Borel reducibility
$\mathrm{E}_{1}$
$E_{3}$

#### Abstract

We prove that if $E$ is an equivalence relation Borel reducible to $E_{1} \times E_{3}$ then either $E$ is Borel reducible to the equality of countable sets of reals or $E_{1}$ is Borel reducible to $E$. The "either" case admits further strengthening.

## 1. Introduction

Let $\mathbb{R}=2^{\mathbb{N}}$. Recall that $E_{1}$ and $E_{3}$ are the equivalence relations defined on the set $\mathbb{R}^{\mathbb{N}}$ as follows:

$$
\begin{aligned}
& x \mathrm{E}_{1} y \quad \text { iff } \quad \exists k_{0} \forall k \geqslant k_{0}(x(k)=y(k)) ; \\
& x \mathrm{E}_{3} y \quad \text { iff } \quad \forall k\left(x(k) \mathrm{E}_{0} y(k)\right)
\end{aligned}
$$

where $E_{0}$ is an equivalence relation defined on $\mathbb{R}$ so that

$$
a \mathrm{E}_{0} b \quad \text { iff } \quad \exists n_{0} \forall n \geqslant n_{0}(a(n)=b(n))
$$

The equivalence $E_{3}$ is often denoted as $\left(E_{0}\right)^{\omega}$.
Kechris and Louveau in [10] and Hjorth and Kechris in [3,4] proved that any Borel equivalence relation $E$ satisfying $E<_{B} E_{1}$, resp., $E<_{B} E_{3}$, also satisfies the non-strict $E \leqslant{ }_{B} E_{0}$. Here $<_{B}$ and $\leqslant B$ are resp. strict and non-strict relations of Borel reducibility. Thus if $E$ is an equivalence relation on a Borel set $X^{2}$ and F is an equivalence relation on a Borel set $Y$ then $\mathrm{E} \leqslant \leqslant_{\mathrm{B}} \mathrm{F}$ means that there exists a Borel map $\vartheta: X \rightarrow Y$ such that

$$
x \in x^{\prime} \Longleftrightarrow \vartheta(x) \mathrm{F} \vartheta\left(x^{\prime}\right)
$$

holds for all $x, x^{\prime} \in X$. Such a map $\vartheta$ is called a (Borel) reduction of $E$ to $F$. If both $E \leqslant_{B} F$ and $F \leqslant{ }_{B} E$ then they write $E \approx_{B} F$ (Borel bi-reducibility), while $E<_{B} F$ (strict reducibility) means that $E \leqslant_{B} F$ but not $F \leqslant_{B} E$. See the cited papers $[3,4]$ or e.g. [2,9] on various aspects of Borel reducibility in set theory and mathematics in general.

[^0]The above mentioned results give a complete description of the $\leqslant_{B}$-structure of Borel equivalence relations below $\mathrm{E}_{1}$ and below $E_{3}$. It is then a natural step to investigate the $\leqslant_{B}$-structure below $E_{13}$, where $E_{13}=E_{1} \times E_{3}$ is the product of $\mathrm{E}_{1}$ and $\mathrm{E}_{3}$, that is, an equivalence on $\mathbb{R}^{\mathbb{N}} \times \mathbb{R}^{\mathbb{N}}$ defined so that for any points $\langle x, \xi\rangle$ and $\langle y, \eta\rangle$ in $\mathbb{R}^{\mathbb{N}} \times \mathbb{R}^{\mathbb{N}},\langle x, \xi\rangle \mathrm{E}_{13}\langle y, \eta\rangle$ if and only if $x \mathrm{E}_{1} y$ and $\xi \mathrm{E}_{3} \eta$.

The intended result would be that the $\leqslant$-cone below $\mathrm{E}_{13}$ includes the cones determined separately by $\mathrm{E}_{1}$ and $\mathrm{E}_{3}$, together with the disjoint union of $E_{1}$ and $E_{3}$ (i.e., the union of $E_{1}$ and $E_{3}$ defined on two disjoint copies of $\mathbb{R}^{\mathbb{N}}$ ), $\mathrm{E}_{13}$ itself, and nothing else. This is however a long shot. The following theorem, the main result of this note, can be considered as a small step in this direction.

Theorem 1. Suppose that $E$ is a Borel equivalence relation and $E \leqslant B E_{13}$. Then either $E$ is Borel reducible to $T_{2}$ or $E_{1} \leqslant B$.
Recall that the equivalence relation $T_{2}$, known as "the equality of countable sets of reals", is defined on $\mathbb{R}^{\mathbb{N}}$ so that $x T_{2} y$ iff $\{x(n): n \in \mathbb{N}\}=\{y(n): n \in \mathbb{N}\}$. It is known that $E_{3}<B T_{2}$ strictly, and there exist many Borel equivalence relations $E$ satisfying $E<_{B} T_{2}$ but incomparable with $E_{3}$ : for instance non-hyperfinite Borel countable ones like $E_{\infty}$. The two cases are incompatible because $E_{1}$ is known not to be Borel reducible to orbit equivalence relations of Polish actions (to which class $\mathrm{T}_{2}$ belongs).

A rather elementary argument reduces Theorem 1 to the following:
Theorem 2. Suppose that $P_{0} \subseteq \mathbb{R}^{\mathbb{N}} \times \mathbb{R}^{\mathbb{N}}$ is a Borel set. Then either the equivalence $\mathrm{E}_{13} \upharpoonright P_{0}$ is Borel reducible to $\mathrm{T}_{2}$ or $\mathrm{E}_{1} \leqslant \mathrm{~B}$ $\mathrm{E}_{13} \upharpoonright P_{0}$.

Indeed suppose that $Z$ (a Borel set) is the domain of $E$, and $\vartheta: Z \rightarrow \mathbb{R}^{\mathbb{N}} \times \mathbb{R}^{\mathbb{N}}$ is a Borel reduction of $E$ to $\mathrm{E}_{13}$. Let $f: Z \rightarrow 2^{\mathbb{N}}=\mathbb{R}$ be an arbitrary Borel injection. Define another reduction $\vartheta^{\prime}: Z \rightarrow \mathbb{R}^{\mathbb{N}} \times \mathbb{R}^{\mathbb{N}}$ as follows. Suppose that $z \in Z$ and $\vartheta(z)=\langle x, \xi\rangle \in \mathbb{R}^{\mathbb{N}} \times \mathbb{R}^{\mathbb{N}}$. Put $\vartheta^{\prime}(z)=\left\langle x^{\prime}, \xi\right\rangle$, where $x^{\prime}$, still a point in $\mathbb{R}^{\mathbb{N}}$, is related to $x$ so that $x^{\prime}(n)=x(n)$ for all $n \geqslant 1$ but $x^{\prime}(0)=f(z)$. Then obviously $\vartheta(z)$ and $\vartheta^{\prime}(z)$ are $\mathrm{E}_{13}$-equivalent for all $z \in Z$, and hence $\vartheta^{\prime}$ is still a Borel reduction of E to $\mathrm{E}_{13}$. On the other hand, $\vartheta^{\prime}$ is an injection (because so is $f$ ). It follows that its full image $P_{0}=\operatorname{ran} \vartheta^{\prime}=\left\{\vartheta^{\prime}(z): z \in Z\right\}$ is a Borel set in $\mathbb{R}^{\mathbb{N}} \times \mathbb{R}^{\mathbb{N}}$, and $\mathrm{E} \approx_{\mathrm{B}} \mathrm{E}_{13} \upharpoonright P_{0}$.

The remainder of the paper contains the proof of Theorem 2. The partition in two cases is described in Section 3. Naturally assuming that $P_{0}$ is a lightface $\Delta_{1}^{1}$ set, Case 1 is essentially the case when for every element $\langle x, \xi\rangle \in P_{0}$ (note that $x, \xi$ are points in $\mathbb{R}^{\mathbb{N}}$ ) and every $n$ we have $x(n)=F\left(x \upharpoonright_{>n}, \xi \upharpoonright \leqslant k, \xi \upharpoonright_{>k}\right)$ for some $k$, where $F$ is a $\Delta_{1}^{1}$ function $\mathrm{E}_{3}$ invariant w.r.t. the 3 rd argument. It easily follows that then the first projection of the equivalence class $[\langle x, \xi\rangle]_{\mathrm{E}_{13}} \cap P_{0}$ of every point $\langle x, \xi\rangle \in P_{0}$ is at most countable, leading to the either option of Theorem 2 in Section 5.

The results of Theorems 1 and 2 in their either parts can hardly be viewed as satisfactory because one would expect it in the form: $E$ is Borel reducible to $E_{3}$. Thus it is a challenging problem to replace $T_{2}$ by $E_{3}$ in the theorems. Attempts to improve the either option, so far rather unsuccessful, lead us to the following:

Theorem 3. In the either case of Theorem 2 there exist a hyperfinite equivalence relation $G$ on a Borel set $P_{0}^{\prime \prime} \subseteq \mathbb{R}^{\mathbb{N}} \times \mathbb{R}^{\mathbb{N}}$ such that $\mathrm{E}_{13} \upharpoonright P_{0}$ is Borel reducible to the least equivalence relation F on $P_{0}^{\prime \prime}$ which includes G and satisfies $\xi \mathrm{E}_{3} \eta \Longrightarrow\langle x, \xi\rangle \mathrm{F}\langle y, \eta\rangle$ for all $\langle x, \xi\rangle$ and $\langle y, \eta\rangle$ in $P_{0}^{\prime \prime}$.

The relation $G$ here is induced by a countable group $\mathbb{G}$ of homeomorphisms of $\mathbb{R}^{\mathbb{N}} \times \mathbb{R}^{\mathbb{N}}$ preserving the second component. (That is, if $g \in \mathbb{G}$ and $g(x, \xi)=\langle y, \eta\rangle$ then $\eta=\xi$, but $y$ generally speaking depends on both $x$ and $\xi$.) And $\mathbb{G}$ happens to be even a locally finite group in the sense that it is equal to the union of an increasing chain of its finite subgroups. Recall that $E_{3}$ is induced by the product group $\mathbb{H}=\left\langle\mathscr{P}_{\text {fin }}(\mathbb{N}) ; \Delta\right\rangle^{\mathbb{N}}$ naturally acting in this case on the second factor in the product $\mathbb{R}^{\mathbb{N}} \times \mathbb{R}^{\mathbb{N}}$. Regarding further details see Section 6 .

Case 2 is treated in Sections 7 through 12. The embedding of $E_{1}$ in $E_{13} \upharpoonright P_{0}$ is obtained by approximately the same splitting construction as the one introduced in [10] (in the version closer to [7]).

## 2. Preliminaries: extension of "invariant" functions

If E is an equivalence relation on a set $X$ then, as usual, $[x]_{\mathrm{E}}=\{y \in X: y \mathrm{E} x\}$ is the E -class of an element $x \in X$, and $[Y]_{\mathrm{E}}=\bigcup_{x \in Y}[x]_{\mathrm{E}}$ is the E -saturation of a set $Y \subseteq X$. A set $Y \subseteq X$ is E -invariant if $Y=[Y]_{\mathrm{E}}$.

The following "invariant" Separation theorem will be used below.

Proposition 4. (5.1 in [1]) Assume that E is a $\Delta_{1}^{1}$ equivalence relation on a $\Delta_{1}^{1}$ set $X \subseteq \mathbb{N}^{\mathbb{N}}$. If $A, C \subseteq X$ are $\Sigma_{1}^{1}$ sets and $[A]_{\mathrm{E}} \cap$ $[C]_{\mathrm{E}}=\emptyset$ then there exists an E -invariant $\Delta_{1}^{1}$ set $B \subseteq X$ such that $[A]_{\mathrm{E}} \subseteq B$ and $[C]_{\mathrm{E}} \cap B=\emptyset$.

Suppose that $f$ is a map defined on a set $Y \subseteq X$. Say that $f$ is E-invariant if $f(x)=f(y)$ for all $x, y \in Y$ satisfying $x \mathrm{E} y$.

Corollary 5. Assume that E is a $\Delta_{1}^{1}$ equivalence relation on a $\Delta_{1}^{1}$ set $A \subseteq \mathbb{N}^{\mathbb{N}}$, and $f: B \rightarrow \mathbb{N}^{\mathbb{N}}$ is an E -invariant $\Sigma_{1}^{1}$ function defined on a $\Sigma_{1}^{1}$ set $B \subseteq A$. Then there exist an $E$-invariant $\Delta_{1}^{1}$ function $g: A \rightarrow \mathbb{N}^{\mathbb{N}}$ such that $f \subseteq g$.

Proof. It obviously suffices to define such a function on an E -invariant $\Delta_{1}^{1}$ set $Z$ such that $Y \subseteq Z \subseteq A$. (Then let $g$ be just a constant on $A \backslash Z$.) The set

$$
P=\left\{\langle a, x\rangle \in A \times \mathbb{N}^{\mathbb{N}}: \forall b((b \in B \wedge a \mathrm{E} b) \Longrightarrow x=f(b))\right\}
$$

is $\Pi_{1}^{1}$ and $f \subseteq P$. Moreover $P$ is F -invariant, where F is defined on $A \times \mathbb{N}^{\mathbb{N}}$ so that $\langle a, x\rangle \mathrm{F}\left\langle a^{\prime}, y\right\rangle$ iff $a \mathrm{E} a^{\prime}$ and $x=y$. Obviously $[f]_{\mathrm{F}} \subseteq P$. Hence by Proposition 4 there exists an F -invariant $\Delta_{1}^{1}$ set $Q$ such that $f \subseteq Q \subseteq P$. Then

$$
R=\{\langle a, x\rangle \in Q: \forall y(y \neq x \Longrightarrow\langle a, y\rangle \notin Q)\}
$$

is an F -invariant $\Pi_{1}^{1}$ set, and in fact a function, satisfying $f \subseteq R$. Applying Proposition 4 once again we end the proof.

## 3. An important population of $\Sigma_{1}^{1}$ functions

Working with elements and subsets of $\mathbb{R}^{\mathbb{N}} \times \mathbb{R}^{\mathbb{N}}$ as the domain of the equivalence relation $\mathrm{E}_{13}$, we'll typically use letters $x, y, z$ to denote points of the first copy of $\mathbb{R}^{\mathbb{N}}$ (where $\mathrm{E}_{1}$ lives) and letters $\xi, \eta, \zeta$ to denote points of the second copy of $\mathbb{R}^{\mathbb{N}}$ (where $E_{3}$ lives). Recall that, for $P \subseteq \mathbb{R}^{\mathbb{N}} \times \mathbb{R}^{\mathbb{N}}$,

$$
\operatorname{dom} P=\{x: \exists \xi(\langle x, \xi\rangle \in P)\} \quad \text { and } \quad \operatorname{ran} P=\{\xi: \exists x(\langle x, \xi\rangle \in P)\}
$$

Points of $\mathbb{R}=2^{\mathbb{N}}$ will be denoted by $a, b, c$.
Assume that $x \in \mathbb{R}^{\mathbb{N}}$. Let $\left.x\right|_{>n}$, resp., $\left.x\right|_{\geqslant n}$ denote the restriction of $x$ (as a map $\mathbb{N} \rightarrow \mathbb{R}$ ) to the domain ( $n, \infty$ ), resp., $[n, \infty)$. Thus $\left.x\right|_{>n} \in \mathbb{R}^{>n}$, where $>n$ means the interval $(n, \infty)$, and $\left.x\right|_{\geqslant n} \in \mathbb{R}^{\geqslant n}$, where $\geqslant n$ means $[n, \infty)$. If $X \subseteq \mathbb{R}^{\mathbb{N}}$ then put $\left.X\right|_{>n}=\left\{\left.x\right|_{>n}: x \in X\right\}$ and $\left.X\right|_{\geqslant n}=\left\{\left.x\right|_{\geqslant n}: x \in X\right\}$.

The notation connected with $\Gamma_{<n}$ and $\Gamma_{\leqslant n}$ is understood similarly.
Let $\xi \equiv_{k} \eta$ mean that $\xi \mathrm{E}_{3} \eta$ and $\xi \upharpoonright_{<k}=\eta \upharpoonright_{<k}$ (that is, $\xi(j)=\eta(j)$ for all $j<k$ ). This is a Borel equivalence on $\mathbb{R}^{\mathbb{N}}$. A set $U \subseteq \mathbb{R}^{\mathbb{N}}$ is $\equiv_{k}$-invariant if $U=[U]_{\equiv_{k}}$, where $[U]_{\equiv_{k}}=\bigcup_{\xi \in U}[\xi]_{\equiv_{k}}$.

Definition 6. Let $\mathscr{F}_{n}^{k}$ denote the set of all $\Sigma_{1}^{1}$ functions ${ }^{3} \varphi: U \rightarrow \mathbb{R}$, defined on a $\Sigma_{1}^{1}$ set $U=\operatorname{dom} \varphi \subseteq \mathbb{R}^{>n} \times \mathbb{R}^{\mathbb{N}}$, and $\equiv_{k}$-invariant in the sense that if $\langle y, \xi\rangle$ and $\langle y, \eta\rangle$ belong to $U$ and $\xi \equiv_{k} \eta$ then $\varphi(y, \xi)=\varphi(y, \eta)$.

Let ${ }^{\mathrm{T}} \mathscr{F}_{n}^{k}$ denote the set of all total functions in $\mathscr{F}_{n}^{k}$, that is, those defined on the whole set $\mathbb{R}^{>n} \times \mathbb{R}^{\mathbb{N}}$.
Lemma 7. If $\varphi \in \mathscr{F}_{n}^{k}$ then there is a $\Delta_{1}^{1}$ function $\psi \in{ }^{\mathbb{T}} \mathscr{F}_{n}^{k}$ with $\varphi \subseteq \psi$.

## Proof. Apply Corollary 5.

Definition 8. Let us fix a suitable coding system $\left\{W^{e}\right\}_{e \in E}$ of all $\Delta_{1}^{1}$ sets $W \subseteq \mathbb{R} \times \mathbb{R}^{\mathbb{N}} \times \mathbb{R}$ (in particular for partial $\Delta_{1}^{1}$ functions $\mathbb{R} \times \mathbb{R}^{\mathbb{N}} \rightarrow \mathbb{R}$ ), where $E \subseteq \mathbb{N}$ is a $\Pi_{1}^{1}$ set, such that there exist a $\Sigma_{1}^{1}$ relation $\boldsymbol{\Sigma}$ and a $\Pi_{1}^{1}$ relation $\Pi$ satisfying

$$
\begin{equation*}
\langle b, \xi, a\rangle \in W^{e} \Longleftrightarrow \boldsymbol{\Sigma}(e, b, a, \xi) \Longleftrightarrow \Pi(e, b, a, \xi) \tag{1}
\end{equation*}
$$

whenever $e \in E$ and $a, b \in \mathbb{R}, \xi \in \mathbb{R}^{\mathbb{N}}$.
Let us fix a $\Delta_{1}^{1}$ sequence of homeomorphisms $H_{n}: \mathbb{R} \xrightarrow{\text { onto }} \mathbb{R} \geqslant n$. Put

$$
\left.\begin{array}{l}
W_{n}^{e}=\left\{\left\langle H_{n}(b), \xi, a\right\rangle:\langle b, \xi, a\rangle \in W^{e}\right\} \quad \text { for } e \in E  \tag{2}\\
T=\left\{\langle e, k\rangle: e \in E \wedge W^{e} \text { is a total and } \equiv_{k} \text {-invariant function }\right\} .
\end{array}\right\}
$$

Here the totality means that $\operatorname{dom} W^{e}=\mathbb{R} \times \mathbb{R}^{\mathbb{N}}$ while the invariance means that $W^{e}(b, \xi)=W^{e}(b, \eta)$ for all $b, \xi, \eta$ satisfying $\xi \equiv_{k} \eta$.

Note that if $\langle e, k\rangle \in T$ then, for any $n, W_{n}^{e}$ is a function in ${ }^{\mathrm{T}} \mathscr{F}_{n}^{k}$, and conversely, every function in ${ }^{\mathrm{T}} \mathscr{F}_{n}^{k}$ has the form $W_{n}^{e}$ for a suitable $e \in E$.

Proposition 9. $T$ is a $\Pi_{1}^{1}$ set.

[^1]Proof. Standard evaluation based on the coding of $\Delta_{1}^{1}$ sets.
Corollary 10. The sets

$$
\begin{aligned}
S_{n}^{k} & =\left\{\langle x, \xi\rangle \in \mathbb{R}^{\mathbb{N}} \times \mathbb{R}^{\mathbb{N}}: \exists \varphi \in \mathscr{F}_{n}^{k}\left(x(n)=\varphi\left(x \upharpoonright_{>n}, \xi\right)\right)\right\} \\
& =\left\{\langle x, \xi\rangle \in \mathbb{R}^{\mathbb{N}} \times \mathbb{R}^{\mathbb{N}}: \exists \varphi \in^{\mathrm{T}} \mathscr{F}_{n}^{k}\left(x(n)=\varphi\left(x \upharpoonright_{>n}, \xi\right)\right)\right\}
\end{aligned}
$$

belong to $\Pi_{1}^{1}$ uniformly on $n, k$. Therefore the set $\mathbf{S}=\bigcup_{m} \bigcap_{n \geqslant m} \bigcup_{k} S_{n}^{k}$ also belongs to $\Pi_{1}^{1}$.
Proof. The equality of the two definitions follows from Lemma 7. The definability follows from Proposition 9 by standard evaluation.

Beginning the proof of Theorem 2, we can w.l.o.g. assume, as usual, that the Borel set $P_{0}$ in the theorem is a lightface $\Delta_{1}^{1}$ set.

Case 1: $\quad P_{0} \subseteq \mathbf{S}$. We'll show that in this case $\mathrm{E}_{13} \upharpoonright P_{0}$ is Borel reducible to $T_{2}$.
Case 2: $\quad P_{0} \backslash \mathbf{S} \neq \emptyset$. We'll prove that then $\mathrm{E}_{1} \leqslant \mathrm{~B} \mathrm{E}_{13} \upharpoonright P_{0}$.

## 4. Case 1: simplification

From now on and until the end of Section 5 we work under the assumptions of Case 1 . The general strategy is to prove that for any $\langle x, \xi\rangle \in P_{0}$ there exist at most countably many points $y \in \mathbb{R}^{\mathbb{N}}$ such that, for some $\eta,\langle y, \eta\rangle \in P_{0}$ and $\langle x, \xi\rangle \mathrm{E}_{13}\langle y, \eta\rangle$, and that those points can be arranged in countable sequences in a certain controlled way.

Our first goal is to somewhat simplify the picture.
Lemma 11. There exists a $\Delta_{1}^{1}$ map $\mu: P_{0} \rightarrow \mathbb{N}$ such that for any $\langle x, \xi\rangle \in P_{0}$ we have $\langle x, \xi\rangle \in \bigcap_{n \geqslant \mu(x, \xi)} \bigcup_{k} S_{n}^{k}$.
Proof. Apply Kreisel Selection to the set

$$
\left\{\langle\langle x, \xi\rangle, m\rangle \in P_{0} \times \mathbb{N}: \forall n \geqslant m \exists k\left(\langle x, \xi\rangle \in S_{n}^{k}\right)\right\} .
$$

Let $\mathbf{0}=0^{\mathbb{N}} \in \mathbb{R}=2^{\mathbb{N}}$ be the constant $0: \mathbf{0}(k)=0$, $\forall k$. For any $\langle x, \xi\rangle \in P_{0}$ put $f_{\mu}(x, \xi)=\mathbf{0}^{\mu(x, \xi) \wedge}(x \mid \geqslant \mu(x, \xi))$ : that is, we replace by $\mathbf{0}$ all values $x(n)$ with $n<\mu(x, \xi)$. Then $P_{0}^{\prime}=\left\{\left\langle f_{\mu}(x, \xi), \xi\right\rangle:\langle x, \xi\rangle \in P_{0}\right\}$ is a $\Sigma_{1}^{1}$ set.

Put $\mathbf{S}^{\prime}=\bigcap_{n} \bigcup_{k} S_{n}^{k}$ (a $\Pi_{1}^{1}$ set by Corollary 10).
Corollary 12. There is a $\Delta_{1}^{1}$ set $P_{0}^{\prime \prime}$ such that $P_{0}^{\prime} \subseteq P_{0}^{\prime \prime} \subseteq \mathbf{S}^{\prime}$. The map $\langle x, \xi\rangle \mapsto\left\langle f_{\mu}(x, \xi), \xi\right\rangle$ is a reduction of $\mathrm{E}_{13} \upharpoonright P_{0}$ to $\mathrm{E}_{13} \upharpoonright P_{0}^{\prime \prime}$.
Proof. Obviously $P_{0}^{\prime}$ is a subset of the $\Pi_{1}^{1}$ set $\mathbf{S}^{\prime}$. It follows that there is a $\Delta_{1}^{1}$ set $P_{0}^{\prime \prime}$ such that $P_{0}^{\prime} \subseteq P_{0}^{\prime \prime} \subseteq \mathbf{S}^{\prime}$. To prove the second claim note that $f_{\mu}(x, \xi) \mathrm{E}_{1} x$ for all $\langle x, \xi\rangle \in P_{0}$.

Let us fix a $\Delta_{1}^{1}$ set $P_{0}^{\prime \prime}$ as indicated. By Corollary 12 to accomplish Case 1 it suffices to get a Borel reduction of $\mathrm{E}_{13} \upharpoonright P_{0}^{\prime \prime}$ to $T_{2}$.

Lemma 13. There exist: a $\Delta_{1}^{1}$ sequence $\left\{\kappa_{n}\right\}_{n \in \mathbb{N}}$ of natural numbers, and a $\Delta_{1}^{1}$ system $\left\{F_{n}^{i}\right\}_{i, n \in \mathbb{N}}$ of functions $F_{n}^{i} \in{ }^{\mathbb{T}} \mathscr{F}_{n}^{\kappa_{i}}$, such that for all $\langle x, \xi\rangle \in P_{0}^{\prime \prime}$ and $n \in \mathbb{N}$ there is $i \in \mathbb{N}$ satisfying $x(n)=F_{n}^{i}\left(\left.x\right|_{>n}, \xi\right)$.

Remark 14. Recall that by definition every function $F \in{ }^{\mathrm{T}} \mathscr{F}_{n}^{k}$ is invariant in the sense that if $\langle x, \xi\rangle$ and $\langle x, \eta\rangle$ belong to $\mathbb{R}^{>n} \times \mathbb{R}^{\mathbb{N}},\left.\xi\right|_{<k}=\eta \upharpoonright_{<k}$, and $\xi \mathrm{E}_{3} \eta$, then $\varphi(x, \xi)=\varphi(x, \eta)$. This allows us to sometimes use the notation like $\left.F_{n}^{i}(x\rceil_{>n}, \xi \upharpoonright_{<k}, \xi \upharpoonright_{\geqslant k}\right)$, where $k=\kappa_{i}$, instead of $F_{n}^{i}\left(x \upharpoonright_{>n}, \xi\right)$, with the understanding that $\left.F_{n}^{i}\left(\left.x\right|_{>n}, \xi \upharpoonright_{<k}, \xi\right\rceil_{\geqslant k}\right)$ is $\mathrm{E}_{3}$ invariant in the 3rd argument.

In these terms, the final equality of the lemma can be re-written as $x(n)=F_{n}^{i}\left(x \upharpoonright_{>n}, \xi \upharpoonright_{<k}, \xi \upharpoonright_{\geqslant k}\right)$, where $k=\kappa_{i}$.
Proof of Lemma 13. By definition $P_{0}^{\prime \prime} \subseteq \mathbf{S}^{\prime}$ means that for any $\langle x, \xi\rangle \in P_{0}^{\prime \prime}$ and $n$ there exists $k$ such that $\langle x, \xi\rangle \in S_{n}^{k}$. The formula $\langle x, \xi\rangle \in S_{n}^{k}$ takes the form

$$
\exists \varphi \in^{\mathrm{T}} \mathscr{F}_{n}^{k} \quad\left(x(n)=\varphi\left(\left.x\right|_{>n}, \xi\right)\right)
$$

and further the form $\exists\langle e, k\rangle \in T\left(x(n)=W_{n}^{e}\left(\left.x\right|_{>n}, \xi\right)\right)$. It follows that the $\Pi_{1}^{1}$ set

$$
Z=\left\{\langle\langle x, \xi, n\rangle,\langle e, k\rangle\rangle \in\left(P_{0} \times \mathbb{N}\right) \times T: x(n)=W_{n}^{e}\left(\left.x\right|_{>n}, \xi\right)\right\}
$$

satisfies $\operatorname{dom} Z=P_{0} \times \mathbb{N}$. Therefore by Kreisel Selection there is a $\Delta_{1}^{1}$ map $\varepsilon: P_{0} \times \mathbb{N} \rightarrow T$ such that $x(n)=W_{n}^{e}\left(\left.x\right|_{>n}, \xi\right)$ holds for any $\langle x, \xi\rangle \in P_{0}$ and $n$, where $\langle e, k\rangle=\varepsilon(x, \xi, n)$ for some $k$.

The range $R=\operatorname{ran} \varepsilon$ of this function is a $\Sigma_{1}^{1}$ subset of the $\Pi_{1}^{1}$ set $T$. We conclude that there is a $\Delta_{1}^{1}$ set $B$ such that $R \subseteq B \subseteq T$. And since $T \subseteq \mathbb{N} \times \mathbb{N}$, it follows, by some known theorems of effective descriptive set theory, that the set $\widehat{E}=\operatorname{dom} B=\{e: \exists k(\langle e, k\rangle \in B)\}$ is $\Delta_{1}^{1}$, and in addition there exists a $\Delta_{1}^{1}$ map $K: \widehat{E} \rightarrow \mathbb{N}$ such that $\langle e, K(e)\rangle \in B$ (and $\in T$ ) for all $e \in \widehat{E}$.

And on the other hand it follows from the construction that

$$
\begin{equation*}
\forall\langle x, \xi\rangle \in P_{0} \forall n \exists e \in \widehat{E} \quad\left(x(n)=W_{n}^{e}\left(x \upharpoonright_{>n}, \xi\right)\right) . \tag{3}
\end{equation*}
$$

Let us fix any $\Delta_{1}^{1}$ enumeration $\{e(i)\}_{i \in \mathbb{N}}$ of elements of $\widehat{E}$. Put $F_{n}^{i}=W_{n}^{e(i)}$. Then the last conclusion of the lemma follows from (3). Note that the functions $F_{n}^{i}$ are uniformly $\Delta_{1}^{1}, F_{n}^{i} \in{ }^{\mathrm{T}} \mathscr{F}_{n}^{k}$ for some $k$, in particular, for $k=\kappa_{i}$, where $\kappa_{i}=K(e(i))$, and $\left\{\kappa_{i}\right\}_{i \in \mathbb{N}}$ is a $\Delta_{1}^{1}$ sequence as well.

Blanket Assumption 15. Below, we assume that the set $P_{0}^{\prime \prime}$ is chosen as above, that is, $\Delta_{1}^{1}$ and $P_{0}^{\prime \prime} \subseteq \mathbf{S}^{\prime}$, while a system of functions $F_{n}^{i}$ and a sequence $\left\{\kappa_{i}\right\}_{i \in \mathbb{N}}$ of natural numbers are chosen accordingly to Lemma 13.

## 5. Case 1: countability of projections of equivalence classes

We prove here that in the assumption of Case 1 the equivalence $E_{13} \upharpoonright P_{0}^{\prime \prime}$ is Borel reducible to $T_{2}$, the equality of countable sets of reals. The main ingredient of this result will be the countability of the sets

$$
C_{x}^{\xi}=\operatorname{dom}\left([\langle x, \xi\rangle]_{\mathrm{E}_{13}} \cap P_{0}^{\prime \prime}\right)=\left\{y \in \mathbb{R}^{\mathbb{N}}: y \mathrm{E}_{1} x \wedge \exists \eta\left(\xi \mathrm{E}_{3} \eta \wedge\langle y, \eta\rangle \in P_{0}^{\prime \prime}\right)\right\}
$$

where $\langle x, \xi\rangle \in P_{0}^{\prime \prime}$ - projections of $\mathrm{E}_{13}$-classes of elements of the set $P_{0}^{\prime \prime}$.

Lemma 16. If $\langle x, \xi\rangle \in P_{0}^{\prime \prime}$ then $C_{x}^{\xi} \subseteq[x]_{\mathrm{E}_{1}}$ and $C_{x}^{\xi}$ is at most countable.
Proof. That $C_{x}^{\xi} \subseteq[x]_{E_{1}}$ is obvious. The proof of countability begins with several definitions. In fact we are going to organize elements of any set of the form $C_{x}^{\xi}$ in a countable sequence.

Recall that $\mathbb{R}=2^{\mathbb{N}}$. If $u \subseteq \mathbb{N}$ and $b \in \mathbb{R}$ then define $u \cdot a \in \mathbb{R}$ so that $(u \cdot a)(j)=a(j)$ whenever $j \notin u$, and $(u \cdot a)(j)=$ $1-a(j)$ otherwise.

If $f \subseteq \mathbb{N} \times \mathbb{N}$ and $a \in \mathbb{R}^{k}$ then define $f \cdot a \in \mathbb{R}^{k}$ so that $(f \cdot a)(j)=\left(f^{\prime \prime} j\right) \cdot a(j)$ for all $j<k$, where $f^{\prime \prime} j=\{m:\langle j, m\rangle \in f\}$. Note that $f \cdot a$ depends in this case only on the restricted set $f \upharpoonright k=\{\langle j, m\rangle \in f: j<k\}$.

Put $\Phi=\mathscr{P}_{\text {fin }}(\mathbb{N} \times \mathbb{N})$ and $D=\bigcup_{n} D_{n}$, where for every $n$ :

$$
D_{n}=\left\{\langle a, \varphi\rangle: a \in \mathbb{N}^{n} \wedge \varphi \in \Phi^{n} \wedge \forall j<n\left(\varphi(j) \subseteq \kappa_{a(j)} \times \mathbb{N}\right)\right\}
$$

(The inclusion $\varphi(j) \subseteq \kappa_{a(j)} \times \mathbb{N}$ here means that the set $\varphi(j) \subseteq \mathbb{N} \times \mathbb{N}$ satisfies $\varphi(j)=\varphi(j) \upharpoonright \kappa_{a(j)}$, that is, every pair $\langle k, l\rangle \in \varphi(j)$ satisfies $k<\kappa_{a(j)}$. .)

If $\langle a, \varphi\rangle \in D_{n}$ and $\langle x, \xi\rangle \in \mathbb{R}^{\mathbb{N}} \times \mathbb{R}^{\mathbb{N}}$ then we define $y=\boldsymbol{\tau}_{x}^{\xi}(a, \varphi) \in \mathbb{R}^{\mathbb{N}}$ as follows: $y=\left\langle b_{0}, b_{1}, \ldots, b_{n-1}\right\rangle^{\wedge}(x \mid \geqslant n)$, where the reals $b_{m} \in \mathbb{R}(m<n)$ are defined by inverse induction so that

$$
\begin{equation*}
b_{m}=F_{m}^{a(m)}\left(\left\langle b_{m+1}, b_{m+2}, \ldots, b_{n-1}\right\rangle^{\wedge}\left(x \upharpoonright_{\geqslant n}\right), \varphi(m) \cdot\left(\xi \upharpoonright_{<\kappa_{a(m)}}\right), \xi \upharpoonright_{\geqslant \kappa_{a(m)}}\right) . \tag{4}
\end{equation*}
$$

(See Remark 14 on notation. The element $\eta=\left(\varphi(m) \cdot\left(\xi \upharpoonright<\kappa_{a(m)}\right)\right)^{\wedge}\left(\xi \upharpoonright \geqslant \kappa_{a(m)}\right)$ belongs to $\mathbb{R}^{\mathbb{N}}$ and satisfies $\eta \mathrm{E}_{3} \xi$ because $\varphi(m)$ is a finite set.)

Put $\boldsymbol{\tau}_{x}^{\xi}(\Lambda, \Lambda)=x$ ( $\Lambda$ is the empty sequence).
Note that by definition the element $y=\boldsymbol{\tau}_{x}^{\xi}(a, \varphi) \in \mathbb{R}^{\mathbb{N}}$ satisfies $\left.y\right|_{\geqslant n}=x \Gamma_{\geqslant n}$ provided $\langle a, \varphi\rangle \in D_{n}$, thus in any case $x \mathrm{E}_{1} \boldsymbol{\tau}_{x}^{\xi}(a, \varphi)$. Thus $\boldsymbol{\tau}_{x}^{\xi}$, the trace of $\langle x, \xi\rangle$, is a countable sequence, that is, a function defined on $D=\bigcup_{n} D_{n}$, a countable set, and the set $\operatorname{ran} \boldsymbol{\tau}_{x}^{\xi}=\left\{\boldsymbol{\tau}_{x}^{\xi}(a, \varphi):\langle a, \varphi\rangle \in D\right\}$ of all terms of this sequence is at most countable and satisfies $x=\boldsymbol{\tau}_{x}^{\xi}(\Lambda, \Lambda) \in$ $\operatorname{ran} \boldsymbol{\tau}_{x}^{\xi} \subseteq[x]_{\mathrm{E}_{1}}$.

Claim 17. Suppose that $\langle x, \xi\rangle \in P_{0}^{\prime \prime}$. Then $C_{x}^{\xi} \subseteq \operatorname{ran} \boldsymbol{\tau}_{x}^{\xi}$ - and hence $C_{x}^{\xi}$ is at most countable. More exactly if $y \in C_{x}^{\xi}$ and $y{ }^{2} \geqslant n=$ $x \upharpoonright \geqslant n$ then there is a pair $\langle a, \varphi\rangle \in D_{n}$ such that $y=\boldsymbol{\tau}_{x}^{\xi}(a, \varphi)$.

We prove the second, more exact part of the claim. By definition there is $\eta \in \mathbb{R}^{\mathbb{N}}$ such that $\langle y, \eta\rangle \in P_{0}^{\prime \prime}$ and $\xi \mathrm{E}_{3} \eta$. Put $b_{m}=y(m), \forall m$. Note that for every $m<n$ there is a number $a(m)$ such that

$$
\begin{aligned}
b_{m} & =F_{m}^{a(m)}\left(\left\langle b_{m+1}, \ldots, b_{n-1}\right\rangle^{\wedge}(y \upharpoonright \geqslant n), \eta\right) \\
& =F_{m}^{a(m)}\left(\left\langle b_{m+1}, \ldots, b_{n-1}\right\rangle^{\wedge}(y \upharpoonright \geqslant n), \eta \upharpoonright<\kappa_{a(m)}, \eta \upharpoonright \geqslant \kappa_{a(m)}\right)
\end{aligned}
$$

for all $m<n$ (see Blanket Assumption 15), and hence

$$
b_{m}=F_{m}^{a(m)}\left(\left\langle b_{m+1}, \ldots, b_{n-1}\right\rangle^{\wedge}(x \upharpoonright \geqslant n), \eta \upharpoonright_{<\kappa_{a(m)}}, \xi \upharpoonright \geqslant \kappa_{a(m)}\right)
$$

by the invariance of functions $F_{m}^{i}$ and because $x \prod_{\geqslant n}=y \upharpoonright_{\geqslant n}$. On the other hand, it follows from the assumption $\xi \mathrm{E}_{3} \eta$ that for every $m<n$ there is a finite set $\varphi(m) \subseteq \kappa_{a(m)} \times \mathbb{N}$ such that $\eta \upharpoonright_{<\kappa_{a(m)}}=\varphi(m) \cdot\left(\xi \upharpoonright_{<\kappa_{a(m)}}\right)$. Then

$$
b_{m}=F_{m}^{a(m)}\left(\left\langle b_{m+1}, \ldots, b_{n-1}\right\rangle^{\wedge}\left(x \upharpoonright_{\geqslant n}\right), \varphi(m) \cdot\left(\left.\xi\right|_{<\kappa_{a(m)}}\right), \xi \upharpoonright_{\left.\geqslant \kappa_{a(m)}\right)}\right)
$$

for every $m<n$, that is, $y=\boldsymbol{\tau}_{x}^{\xi}(a, \varphi)$, as required.
(Claim and Lemma 16)
The next result reduces the equivalence relation $E_{13} \upharpoonright P_{0}^{\prime \prime}$ to the equality of sets of the form ran $\boldsymbol{\tau}_{x}^{\xi}$, that is essentially to the equivalence relation $T_{2}$ of "equality of countable sets of reals".

Corollary 18. Suppose that $\langle x, \xi\rangle$ and $\langle y, \eta\rangle$ belong to $P_{0}^{\prime \prime}$. Then $\langle x, \xi\rangle \mathrm{E}_{13}\langle y, \eta\rangle$ holds if and only if $\xi \mathrm{E}_{3} \eta$ and ran $\boldsymbol{\tau}_{x}^{\xi}=\operatorname{ran} \boldsymbol{\tau}_{y}^{\eta}$.

Proof. The "if" direction is rather easy. If $\xi \mathrm{E}_{3} \eta$ and $\operatorname{ran} \boldsymbol{\tau}_{y}^{\eta}=\operatorname{ran} \boldsymbol{\tau}_{x}^{\xi}$ then $x \mathrm{E}_{1} y$ because $\operatorname{ran} \boldsymbol{\tau}_{y}^{\eta} \subseteq[y]_{\mathrm{E}_{1}}$ and ran $\boldsymbol{\tau}_{x}^{\xi} \subseteq$ $[x]_{E_{1}}$ by Lemma 16.

To prove the converse suppose that $\langle x, \xi\rangle \mathrm{E}_{13}\langle y, \eta\rangle$. Then $\xi \mathrm{E}_{3} \eta$, of course. Furthermore, $x \mathrm{E}_{1} y$, therefore $x{ }^{2} \geqslant n=y{ }^{2} \geqslant n$ for an appropriate $n$. Let us prove that $\operatorname{ran} \boldsymbol{\tau}_{y}^{\eta}=\operatorname{ran} \boldsymbol{\tau}_{x}^{\xi}$. First of all, by definition we have $y \in C_{x}^{\xi}$, and hence (see the proof of Claim 17) there exists a pair $\langle a, \varphi\rangle \in D_{n}$ such that $y=\boldsymbol{\tau}_{x}^{\xi}(a, \varphi)$.

Now, let us establish $\operatorname{ran} \boldsymbol{\tau}_{x}^{\xi}=\operatorname{ran} \boldsymbol{\tau}_{y}^{\xi}$ (with one and the same $\xi$ ). Suppose that $z \in \operatorname{ran} \boldsymbol{\tau}_{x}^{\xi}$, that is, $z=\boldsymbol{\tau}_{x}^{\xi}(b, \psi)$ for a pair $\langle b, \psi\rangle \in D_{m}$ for some $m$. If $m \geqslant n$ then obviously $z=\boldsymbol{\tau}_{x}^{\xi}(b, \psi)=\boldsymbol{\tau}_{y}^{\xi}(b, \psi)$, and hence (as $x \prod_{\geqslant n}=y \mid \geqslant n$ ) $z \in \operatorname{ran} \boldsymbol{\tau}_{y}^{\xi}$. If $m<n$ then $z=\boldsymbol{\tau}_{x}^{\xi}(b, \psi)=\boldsymbol{\tau}_{y}^{\xi}\left(a^{\prime}, \varphi^{\prime}\right)$, where $a^{\prime}=b^{\wedge}\left(a \Gamma_{\geqslant m}\right)$ and $\varphi^{\prime}=\psi^{\wedge}(\varphi \mid \geqslant m)$, and once again $z \in \operatorname{ran} \boldsymbol{\tau}_{y}^{\xi}$. Thus $\operatorname{ran} \boldsymbol{\tau}_{x}^{\xi} \subseteq \operatorname{ran} \boldsymbol{\tau}_{y}^{\xi}$. The proof of the inverse inclusion $\operatorname{ran} \boldsymbol{\tau}_{y}^{\xi} \subseteq \operatorname{ran} \boldsymbol{\tau}_{x}^{\xi}$ is similar.

Thus $\operatorname{ran} \boldsymbol{\tau}_{y}^{\xi}=\operatorname{ran} \boldsymbol{\tau}_{x}^{\xi}$. It remains to prove $\operatorname{ran} \boldsymbol{\tau}_{y}^{\eta}=\operatorname{ran} \boldsymbol{\tau}_{y}^{\xi}$ for all $y, \xi, \eta$ such that $\xi \mathrm{E}_{3} \eta$. Here we need another block of definitions.

Let $\mathbb{H}$ be the set of all sets $\delta \subseteq \mathbb{N} \times \mathbb{N}$ such that $\delta^{\prime \prime} j=\{m:\langle j, m\rangle \in \delta\}$ is finite for all $j \in \mathbb{N}$. For instance if $\xi, \eta \in \mathbb{R}^{\mathbb{N}}$ satisfy $\xi \mathrm{E}_{3} \eta$ then the set

$$
\boldsymbol{\delta}_{\xi \eta}=\{\langle j, m\rangle: \xi(j)(m) \neq \eta(j)(m)\}
$$

belongs to $\mathbb{H}$. The operation of symmetric difference $\Delta$ converts $\mathbb{H}$ into a Polish group equal to the product group $\left\langle\mathscr{P}_{\text {fin }}(\mathbb{N}) ; \Delta\right\rangle^{\mathbb{N}}$.

If $n \in \mathbb{N},\langle a, \varphi\rangle \in D_{n}$, and $\delta \in \mathbb{H}$ then we define a sequence $\varphi^{\prime}=H_{\delta}^{a}(\varphi) \in \Phi^{n}$ so that $\varphi^{\prime}(m)=\left(\delta \upharpoonright \kappa_{a(m)}\right) \Delta \varphi(m)$ for every $m<n .{ }^{4}$ Then the pair $\left\langle a, H_{\delta}^{a}(\varphi)\right\rangle$ obviously still belongs to $D_{n}$ and $H_{\delta}^{a}\left(H_{\delta}^{a}(\varphi)\right)=\varphi$.

Coming back to a triple of $y, \xi, \eta \in \mathbb{R}^{\mathbb{N}}$ such that $\xi \mathrm{E}_{3} \eta$, let $\delta=\boldsymbol{\delta}_{\xi \eta}$. A routine verification shows that $\boldsymbol{\tau}_{y}^{\eta}(a, \varphi)=$ $\boldsymbol{\tau}_{y}^{\xi}\left(a, H_{\delta}^{a}(\varphi)\right)$ for all $\langle a, \varphi\rangle \in D$. It follows that $\operatorname{ran} \boldsymbol{\tau}_{y}^{\eta}=\operatorname{ran} \boldsymbol{\tau}_{y}^{\xi}$, as required.

Corollary 19. The restricted relation $\mathrm{E}_{13} \upharpoonright P_{0}^{\prime \prime}$ is Borel reducible to $\mathrm{T}_{2}$.
Proof. Since all $\boldsymbol{\tau}_{x}^{\xi}$ are countable sequences of reals, the equality $\operatorname{ran} \boldsymbol{\tau}_{y}^{\eta}=\operatorname{ran} \boldsymbol{\tau}_{x}^{\xi}$ of Corollary 18 is Borel reducible to $\mathrm{T}_{2}$. Thus $\mathrm{E}_{13} \upharpoonright P_{0}^{\prime \prime}$ is Borel reducible to $\mathrm{E}_{3} \times \mathrm{T}_{2}$ by Corollary 18. However it is known that $\mathrm{E}_{3}$ is Borel reducible to $\mathrm{T}_{2}$, and so does $T_{2} \times T_{2}$.
$\square$ (Case 1 of Theorem 2)

## 6. Case 1: a more elementary (?) transformation group

Here we sketch the proof of Theorem 3; see [6] for a full proof. Arguing under the assumptions of Case 1, we define a closed set

$$
\boldsymbol{\Pi}=\left\{\langle x, \xi\rangle \in \mathbb{R}^{\mathbb{N}} \times \mathbb{R}^{\mathbb{N}}: \forall n \exists\langle a, \varphi\rangle \in D_{n}\left(x=\boldsymbol{\tau}_{x}^{\xi}(a, \varphi)\right)\right\}
$$

[^2]It satisfies $P_{0}^{\prime \prime} \subseteq \Pi$ by Claim 17. Suppose that pairs $\langle a, \varphi\rangle,\langle b, \psi\rangle$ belong to $D_{n}$ for the same $n$, and $\langle x, \xi\rangle \in \mathbb{R}^{\mathbb{N}} \times \mathbb{R}^{\mathbb{N}}$. Put $G_{a \varphi}^{b \psi}(x, \xi)=\langle y, \xi\rangle \in \mathbb{R}^{\mathbb{N}} \times \mathbb{R}^{\mathbb{N}}$, where

$$
y= \begin{cases}\boldsymbol{\tau}_{x}^{\xi}(b, \psi) & \text { whenever } x=\boldsymbol{\tau}_{x}^{\xi}(a, \varphi) \\ \boldsymbol{\tau}_{x}^{\xi}(a, \varphi) & \text { whenever } x=\boldsymbol{\tau}_{x}^{\xi}(b, \psi) \\ x & \text { whenever } \boldsymbol{\tau}_{x}^{\xi}(a, \varphi) \neq x \neq \boldsymbol{\tau}_{x}^{\xi}(b, \psi)\end{cases}
$$

In our assumptions, $\left.y\right|_{\geqslant n}=x \upharpoonright_{\geqslant n}$ and $G_{a \varphi}^{b \psi}$ is a homeomorphism of $\mathbb{R}^{\mathbb{N}} \times \mathbb{R}^{\mathbb{N}}$ onto itself and of $\Pi$ onto itself, and $G_{a \varphi}^{b \psi}=G_{b \psi}^{a \varphi}$. In addition we have $\operatorname{ran} \boldsymbol{\tau}_{x}^{\xi}=\operatorname{ran} \boldsymbol{\tau}_{y}^{\xi}$ whenever $\langle y, \xi\rangle=G_{a \varphi}^{b \psi}(x, \xi)$.

The group $\mathbb{G}$ of all superpositions of maps of the form $G_{a \varphi}^{b \psi}$, where $\langle a, \varphi\rangle,\langle b, \psi\rangle$ belong to one and the same set $D_{n}$, is a countable group of homeomorphisms of $\mathbb{R}^{\mathbb{N}} \times \mathbb{R}^{\mathbb{N}}$. Consider the equivalence relation $G$ induced by $\mathbb{G}$ on $\Pi$. Thus $\langle x, \xi\rangle \mathrm{G}\langle y, \eta\rangle$ iff there exists a homeomorphism $g \in \mathbb{G}$ such that $g(x, \xi)=\langle y, \eta\rangle$ (and then by definition $\eta=\xi$ ).

Now let us study relations between $\mathbb{G}$ and $\mathbb{H}$, the group introduced in the proof of Corollary 18. For any $\delta \in \mathbb{H}$ define a homeomorphism $H_{\delta}$ of $\mathbb{R}^{\mathbb{N}} \times \mathbb{R}^{\mathbb{N}}$ so that $H_{\delta}(x, \xi)=\langle x, \eta\rangle$, where simply $\eta=\delta \Delta \xi$ in the sense that

$$
\eta(m, j)= \begin{cases}\xi(m, j) & \text { whenever }\langle m, j\rangle \notin \delta \\ 1-\xi(m, j) & \text { whenever }\langle m, j\rangle \in \delta\end{cases}
$$

(Then obviously $\delta=\delta_{\xi \eta}$.) If $\gamma, \delta \in \mathbb{H}$ then the superposition $H_{\delta} \circ H_{\gamma}$ coincides with $H_{\gamma \Delta \delta}$, where $\Delta$ is the symmetric difference, as usual. Transformations of the form $G_{a \varphi}^{b \psi}$ do not commute with those of the form $H_{\delta}$, yet there exists a convenient and easy to verify law of commutation:

Lemma 20. Suppose that $n \in \mathbb{N}$ and pairs $\langle a, \varphi\rangle$ and $\langle b, \psi\rangle$ belong to $D_{n}$, and $\delta \in \mathbb{H}$. Then the superposition $G_{a \varphi}^{b \psi} \circ H_{\delta}$ coincides with $H_{\delta} \circ G_{a \varphi^{\prime}}^{b \psi^{\prime}}$, where $\varphi^{\prime}=H_{\delta}^{a}(\varphi)$ and $\psi^{\prime}=H_{\delta}^{b}(\psi)$.

It follows that the set $\mathbb{S}$ of all homeomorphisms $s: \mathbb{R}^{\mathbb{N}} \times \mathbb{R}^{\mathbb{N}} \rightarrow \mathbb{R}^{\mathbb{N}} \times \mathbb{R}^{\mathbb{N}}$ of the form $s=H_{\delta} \circ g_{\ell-1} \circ g_{\ell-2} \circ \cdots \circ g_{1} \circ g_{0}$, where $\ell \in \mathbb{N}, \delta \in \mathbb{H}$, and each $g_{i}$ is a homeomorphism of $\mathbb{R}^{\mathbb{N}} \times \mathbb{R}^{\mathbb{N}}$ of the form $G_{a_{i} \varphi_{i}}^{b_{i} \psi_{i}}$, and the pairs $\left\langle a_{i}, \varphi_{i}\right\rangle,\left\langle b_{i}, \psi_{i}\right\rangle$ belong to one and the same set $D_{n}, n=n_{i}$ (then $g_{\ell-1} \circ g_{\ell-2} \circ \cdots \circ g_{1} \circ g_{0} \in \mathbb{G}$ ), - is a group under the superposition. For instance if $g=G_{a \varphi}^{b \psi}$ and $g_{1}$ belong to $\mathbb{G}$ (and $\langle a, \varphi\rangle,\langle b, \psi\rangle$ belong to one and the same $D_{n}$ ) then the superposition $H_{\delta} \circ g \circ H_{\delta_{1}} \circ g_{1}$ coincides with $H_{\delta} \circ H_{\delta_{1}} \circ g^{\prime} \circ g_{1}=H_{\delta \Delta \delta_{1}} \circ\left(g^{\prime} \circ g_{1}\right)$, where $g^{\prime}=G_{a \varphi^{\prime}}^{b \psi^{\prime}}$ and $\varphi^{\prime}=H_{\delta_{1}}^{a}(\varphi), \psi^{\prime}=H_{\delta_{1}}^{b}(\psi)$ as in Lemma 20.

Thus $\mathbb{S}$ is a more complicated group than the direct cartesian product of $\mathbb{G}$ and $\mathbb{H}$, but on the other hand more elementary than the free product (of all formal superpositions of elements of both groups). The action of $\mathbb{S}$ on $\mathbb{R}^{\mathbb{N}} \times \mathbb{R}^{\mathbb{N}}$ is defined as follows: if $s$ is as above then $s \cdot\langle x, \xi\rangle=H_{\delta}\left(g_{\ell-1}\left(g_{\ell-2}\left(\cdots g_{1}\left(g_{0}(x, \xi)\right) \cdots\right)\right)\right)$. One can easily check that both the group $\mathbb{S}$ and the action are Polish. On the other hand, the induced orbit equivalence relation $S$ is equal to the conjunction $F$ of $G$ and the equivalence relation $E_{3}$ acting on the 2 nd factor of $\mathbb{R}^{\mathbb{N}} \times \mathbb{R}^{\mathbb{N}}$, in the sense of Theorem 3 in the Introduction.

Moreover, we have $\langle x, \xi\rangle \mathrm{E}_{13}\langle y, \eta\rangle$ iff $\langle x, \xi\rangle S\langle y, \eta\rangle$ for any $\langle x, \xi\rangle,\langle y, \eta\rangle \in P_{0}^{\prime \prime}$.
The final step is the next lemma. Its proof, not really obvious, see in [6].
Lemma 21. $\mathbb{G}$ is the union of an increasing sequence of finite subgroups, therefore the induced equivalence relation $G$ is hyperfinite.
(Theorem 3)
The arguments above reduce further study of Case 1 of Theorem 2 to properties of the group $\mathbb{S}$ and its Polish actions. This is an open topic, and maybe the local finiteness of $\mathbb{G}$ (by Lemma 21) can lead to more comprehensive results.

## 7. Case 2

Then the $\Sigma_{1}^{1}$ set $R=P_{0} \cap \mathbf{H}$, where $\mathbf{H}=2^{\mathbb{N}} \backslash \mathbf{S}$ is the chaotic domain, is non-empty. Our goal will be to prove that $\mathrm{E}_{1} \leqslant{ }_{\mathrm{B}} \mathrm{E}_{13} \upharpoonright R$ in this case. The embedding $\vartheta: \mathbb{R}^{\mathbb{N}} \rightarrow R$ will have the property that any two elements $\langle x, \xi\rangle$ and $\left\langle x^{\prime}, \xi^{\prime}\right\rangle$ in the range $\operatorname{ran} \vartheta \subseteq R$ satisfy $\xi \mathrm{E}_{3} \xi^{\prime}$, so that the $\xi^{\prime}$-component in the range of $\vartheta$ is trivial. And as far as the $x$-component is concerned, the embedding will resemble the embedding defined in Case 1 of the proof of the 1 st dichotomy theorem in [10] (see also [8, Ch. 8]).

Recall that sets $S_{n}^{k}$ were defined in Corollary 10, and by definition

$$
\left.\begin{array}{rl}
\langle x, \xi\rangle \in \mathbf{H} & \Longrightarrow \quad \forall m \exists n \geqslant m \forall k\left(\langle x, \xi\rangle \notin S_{n}^{k}\right)  \tag{5}\\
& \Longrightarrow \quad \forall m \exists n \geqslant m \forall k \forall \varphi \in \mathscr{F}_{n}^{k}\left(x(n) \neq \varphi\left(\left.x\right|_{>n}, \xi\right)\right)
\end{array}\right\}
$$

in Case 2. Prove a couple of related technical lemmas.

Lemma 22. Each set $S_{n}^{k}$ is invariant in the following sense: if $\langle x, \xi\rangle \in S_{n}^{k},\langle y, \eta\rangle \in \mathbb{R}^{\mathbb{N}} \times \mathbb{R}^{\mathbb{N}}, x\left\lceil\geqslant n=\left.y\right|_{\geqslant n}\right.$, and $\xi \mathrm{E}_{3} \eta$ then $\langle y, \eta\rangle \in S_{n}^{k}$.

Proof. Otherwise there is a $\Delta_{1}^{1}$ function $\varphi \in^{\mathrm{T}} \mathscr{F}_{n}^{k}$ such that $y(n)=\varphi\left(\left.y\right|_{>n}, \eta\right)$. Then $x(n)=\varphi\left(\left.x\right|_{>n}, \eta\right)$ as well because $x{ }^{2} \geqslant n=y \upharpoonright_{\geqslant n}$. We put

$$
u_{j}=\xi(j) \Delta \eta(j)=\{m: \xi(j)(m) \neq \eta(j)(m)\}
$$

for every $j<k$, these are finite subsets of $\mathbb{N}$. If $a \in 2^{\mathbb{N}}$ and $u \subseteq \mathbb{N}$ then define $u \cdot a \in 2^{\mathbb{N}}$ so that $(u \cdot a)(m)=a(m)$ for $m \notin u$, and $(u \cdot a)(m)=a(m)$ for $m \notin u$. If $\zeta \in \mathbb{R}^{\mathbb{N}}$ then define $f(\zeta) \in \mathbb{R}^{\mathbb{N}}$ so that $f(\zeta)(j)=u_{j} \cdot \zeta(j)$ for $j<k$, and $f(\zeta)(j)=\zeta(j)$ for $j \geqslant k$.

Finally, put $\psi(z, \zeta)=\varphi(z, f(\zeta))$ for every $\langle z, \zeta\rangle \in \mathbb{R}^{>n} \times \mathbb{R}^{\mathbb{N}}$. The map $\psi$ obviously belongs to ${ }^{\mathrm{T}} \mathscr{F}_{n}^{k}$ together with $\varphi$. Moreover

$$
x(n)=\varphi\left(\left.x\right|_{>n}, \eta\right)=\psi\left(\left.x\right|_{>n}, f(\eta)\right)=\psi\left(\left.x\right|_{>n}, \xi\right)
$$

because $f(\eta) \upharpoonright_{<k}=\xi \upharpoonright_{<k}$, and this contradicts to the choice of $\langle x, \xi\rangle$.
The next simple lemma will allow us to split $\Sigma_{1}^{1}$ sets in $\mathbb{R}^{\mathbb{N}} \times \mathbb{R}^{\mathbb{N}}$.
Lemma 23. If $P \subseteq \mathbb{R}^{\mathbb{N}} \times \mathbb{R}^{\mathbb{N}}$ is a $\Sigma_{1}^{1}$ set and $P \nsubseteq S_{n}^{k}$ then there exist points $\langle x, \xi\rangle$ and $\langle y, \eta\rangle$ in $P$ with

$$
y \upharpoonright_{>n}=x \upharpoonright_{>n}, \quad \eta \mathrm{E}_{3} \xi, \quad \eta \upharpoonright_{<k}=\xi \upharpoonright_{<k}, \quad \text { but } \quad y(n) \neq x(n) .
$$

Proof. Otherwise $\psi=\left\{\left\langle\left\langle\left. y\right|_{>n}, \eta\right\rangle, y(n)\right\rangle:\langle y, \eta\rangle \in P\right\}$ is a map in $\mathscr{F}_{n}^{k}$, and hence $P \subseteq S_{n}^{k}$, contradiction.

## 8. Case 2: splitting system

We apply a splitting construction, developed in [5] for the study of "ill"founded Sacks iterations. Below, $2^{n}$ will typically denote the set of all dyadic sequences of length $n$, and $2^{<\omega}=\bigcup_{n} 2^{n}=$ all finite dyadic sequences.

The construction involves a map $\varphi: \mathbb{N} \rightarrow \mathbb{N}$ assuming infinitely many values and each its value infinitely many times (but $\operatorname{ran} \varphi$ may be a proper subset of $\mathbb{N}$ ), another map $\pi: \mathbb{N} \rightarrow \mathbb{N}$, and, for each $u \in 2^{<\omega}$, a non-empty $\Sigma_{1}^{1}$ subset $P_{u} \subseteq R=\mathbf{H} \cap P_{0}$ - which satisfy a quite long list of properties.

First of all, if $\varphi$ is already defined at least on $[0, n)$ and $u \neq v \in 2^{n}$ then let $\nu_{\varphi}[u, v]=\max \{\varphi(\ell): \ell<n \wedge u(\ell) \neq v(\ell)\}$. And put $v_{\varphi}[u, u]=-1$ for any $u$.

Now we present the list of requirements $1^{\circ}-8^{\circ}$.
$1^{\circ}:$ if $\varphi(n) \notin\{\varphi(\ell): \ell<n\}$ then $\varphi(n)>\varphi(\ell)$ for each $\ell<n$;
$2^{\circ}$ : if $u \in 2^{n}$ then $P_{u} \cap\left(\bigcup_{k} S_{\varphi(\ell)}^{k}\right)=\emptyset$ for each $\ell<n$;
$3^{\circ}$ : every $P_{u}$ is a non-empty $\Sigma_{1}^{1}$ subset of $R \cap \mathbf{H}$;
$4^{\circ}: P_{u^{\wedge} i} \subseteq P_{u}$ for all $u \in 2^{<\omega}$ and $i=0,1$.
Two further conditions are related rather to the sets $X_{u}=\operatorname{dom} P_{u}$.
$5^{\circ}$ : if $u, v \in 2^{n}$ then $X_{u} \upharpoonright_{>v_{\varphi}[u, v]}=X_{v} \upharpoonright_{>v_{\varphi}[u, v]}$;
$6^{\circ}:$ if $u, v \in 2^{n}$ then $X_{u} \upharpoonright \geqslant v_{\varphi}[u, v] \cap X_{v} \upharpoonright \geqslant v_{\varphi}[u, v]=\emptyset$.
The content of the next condition is some sort of genericity in the sense of the Gandy-Harrington forcing in the space $\mathbb{R}^{\mathbb{N}} \times \mathbb{R}^{\mathbb{N}}$, that is, the forcing notion

$$
\mathbb{P}=\text { all non-empty } \Sigma_{1}^{1} \text { subsets of } \mathbb{R}^{\mathbb{N}} \times \mathbb{R}^{\mathbb{N}}
$$

Let us fix a countable transitive model $\boldsymbol{M}$ of a sufficiently large fragment of ZFC. ${ }^{5}$ For technical reasons, we assume that $\boldsymbol{M}$ is an elementary submodel of the universe w.r.t. all analytic formulas. Then simple relations between sets in $\mathbb{P}$ in the universe, like $P=Q$ or $P \subseteq Q$, are adequately reflected as the same relations between their intersections $P \cap \boldsymbol{M}, Q \cap \boldsymbol{M}$ with the model $\boldsymbol{M}$. In this sense $\mathbb{P}$ is a forcing notion in $\boldsymbol{M}$.

A set $D \subseteq \mathbb{P}$ is open dense iff, first, for any $P \in \mathbb{P}$ there is $Q \in D, Q \subseteq P$, and given sets $P \subseteq Q \in \mathbb{R}$, if $Q$ belongs to $D$ then so does $P$. A set $D \subseteq \mathbb{P}$ is coded in $\boldsymbol{M}$, iff the set $\{P \cap \boldsymbol{M}: P \in D\}$ belongs to $\boldsymbol{M}$. There exists at most countably many such sets because $\boldsymbol{M}$ is countable. Let us fix an enumeration (not in $\boldsymbol{M}$ ) $\left\{D_{n}: n \in \mathbb{N}\right\}$ of all open dense sets $D \subseteq \mathbb{P}$ coded in $\boldsymbol{M}$.

[^3]The next condition essentially asserts the $\mathbb{P}$-genericity of each branch in the splitting construction over $\boldsymbol{M}$.
$7^{\circ}$ : for every $n$, if $u \in 2^{n+1}$ then $P_{u} \in D_{n}$.
Remark 24. It follows from $7^{\circ}$ that for any $a \in 2^{\mathbb{N}}$ the sequence $\left\{P_{a \upharpoonright n}\right\}_{n \in \mathbb{N}}$ is generic enough for the intersection $\bigcap_{n} P_{a \upharpoonright n} \neq$ $\emptyset$ to consist of a single point, say $\langle g(a), \gamma(a)\rangle$, and for the maps $g, \gamma: 2^{\mathbb{N}} \rightarrow \mathbb{R}^{\mathbb{N}} \times \mathbb{R}^{\mathbb{N}}$ to be continuous.

Note that $g$ is $1-1$. Indeed if $a \neq b$ belong to $2^{\mathbb{N}}$ then $a(n) \neq b(n)$ for some $n$, and hence $v_{\varphi}[a \upharpoonright m, b \upharpoonright m] \geqslant \varphi(n)$ for all $m \geqslant n$. It follows by $6^{\circ}$ that $X_{a \upharpoonright m} \cap X_{b \upharpoonright m}=\emptyset$ for $m>n$, therefore $g(a) \neq g(b)$.

Our final requirement involves the $\xi$-parts of sets $P_{u}$. We'll need the following definition. Suppose that $\langle x, \xi\rangle$ and $\langle y, \eta\rangle$ belong to $\mathbb{R}^{\mathbb{N}} \times \mathbb{R}^{\mathbb{N}}, p \in \mathbb{N}$, and $s \in \mathbb{N}^{<\omega}$, 1h $s=m$ (the length of $s$ ). Define $\langle x, \xi\rangle \cong_{p}^{s}\langle y, \eta\rangle$ iff

$$
\xi \mathrm{E}_{3} \eta, \quad x \upharpoonright_{>p}=y \upharpoonright_{>p}, \quad \text { and } \quad \xi(k) \Delta \eta(k) \subseteq s(k) \quad \text { for all } k<m=\operatorname{lh} s,
$$

where $\alpha \Delta \beta=\{j: \alpha(j) \neq \beta(j)\}$ for $\alpha, \beta \in 2^{\mathbb{N}}$. If $P, Q \subseteq \mathbb{R}^{\mathbb{N}} \times \mathbb{R}^{\mathbb{N}}$ are arbitrary sets then under the same circumstances $P \cong{ }_{p}^{s} Q$ will mean that

$$
\forall\langle x, \xi\rangle \in P \exists\langle y, \eta\rangle \in Q\left(\langle x, \xi\rangle \cong_{p}^{s}\langle y, \eta\rangle\right) \quad \text { and vice versa. }
$$

Obviously $\cong_{p}^{s}$ is an equivalence relation.
The following is the last condition:
$8^{\circ}$ : there exists a map $\pi: \mathbb{N} \rightarrow \mathbb{N}$, such that $P_{u} \cong \cong_{\nu_{\varphi}[u, v]}^{\pi\lceil n} P_{v}$ holds for every $n$ and all $u, v \in 2^{n}$ (and then $X_{u} \upharpoonright_{>v_{\varphi}[u, v]}=$ $\left.X_{v}\right|_{>v_{\varphi}[u, v]}$ as in $\left.5^{\circ}\right)$.

## 9. Case 2: splitting system implies the reducibility

Here we prove that any system of sets $P_{u}$ and $X_{u}=\operatorname{dom} P_{u}$ and maps $\varphi, \pi$ satisfying $1^{\circ}-8^{\circ}$ implies Borel reducibility of $\mathrm{E}_{1}$ to $\mathrm{E}_{13} \upharpoonright R$. This completes Case 2 . The construction of such a splitting system will follow in the remainder.

Let the maps $g$ and $\gamma$ be defined as in Remark 24. Put

$$
W=\left\{\langle g(a), \gamma(a)\rangle: a \in 2^{\mathbb{N}}\right\}
$$

Lemma 25. $W$ is a closed set in $\mathbb{R}^{\mathbb{N}} \times \mathbb{R}^{\mathbb{N}}$ and a function. Moreover if $\langle x, \xi\rangle$ and $\langle y, \eta\rangle$ belong to $W$ then $\xi \mathrm{E}_{3} \eta$.
Proof. $W$ is closed as a continuous image of $2^{\mathbb{N}}$. That $W$ is a function follows from the bijectivity of $g$, see Remark 24 . Finally any two $\xi, \eta$ as indikated satisfy $\xi(k) \Delta \eta(k) \subseteq \pi(k)$ for all $k$ by $8^{\circ}$.

Put $X=\operatorname{dom} W$. Thus $W$ is a continuous map $X \rightarrow \mathbb{R}^{\mathbb{N}}$ by the lemma.
Corollary 26. There exists a Borel reduction of $\mathrm{E}_{1} \upharpoonright X$ to $\mathrm{E}_{13} \upharpoonright W$.
Proof. As $W$ is a function, we can use the notation $W(x)$ for $x \in X=\operatorname{dom} W$. Put $f(x)=\langle x, W(x)\rangle$. This is a Borel, even a continuous map $X \rightarrow W$. It remains to establish the equivalence

$$
\begin{equation*}
x \mathrm{E}_{1} y \Longleftrightarrow f(x) \mathrm{E}_{13} f(y) \text { for all } x, y \in X \tag{6}
\end{equation*}
$$

If $x \mathrm{E}_{1} y$ then $W(x) \mathrm{E}_{3} W(y)$ by Lemma 25, and hence easily $f(x) \mathrm{E}_{13} f(y)$. If $x \mathrm{E}_{1} y$ fails then obviously $f(x) \mathrm{E}_{13} f(y)$ fails, too.

Thus to complete Case 2 it now suffices to define a Borel reduction of $\mathrm{E}_{1}$ to $\mathrm{E}_{1} \upharpoonright X$. To get such a reduction consider the set $\Phi=\operatorname{ran} \varphi$, and let $\Phi=\left\{p_{m}: m \in \mathbb{N}\right\}$ in the increasing order; that the set $\Phi \subseteq \mathbb{N}$ is infinite follows from $1^{\circ}$.

Suppose that $n \in \mathbb{N}$. Then $\varphi(n)=p_{m}$ for some (unique) $m$ : we put $\psi(n)=m$. Thus $\psi: \mathbb{N} \xrightarrow{\text { onto }} \mathbb{N}$ and the preimage $\psi^{-1}(m)=\varphi^{-1}\left(p_{m}\right)$ is an infinite subset of $\mathbb{N}$ for any $m$. Define a parallel system of sets $Y_{u} \subseteq \mathbb{R}^{\mathbb{N}}, u \in 2^{<\omega}$, as follows. Put $Y_{\Lambda}=\mathbb{R}^{\mathbb{N}}$. Suppose that $Y_{u}$ has been defined, $u \in 2^{n}$. Put $p=\varphi(n)=p_{\psi(n)}$. Let $K$ be the number of all indices $\ell<n$ still satisfying $\varphi(\ell)=p$, perhaps $K=0$. Put $Y_{u^{\wedge} i}=\left\{x \in Y_{u}: x(p)(K)=i\right\}$ for $i=0,1$.

Each of $Y_{u}$ is clearly a basic clopen set in $\mathbb{R}^{\mathbb{N}}$, and one easily verifies that conditions $4^{\circ}-6^{\circ}$ are satisfied for the sets $Y_{u}$ and the map $\psi$ (instead of $\varphi$ in $5^{\circ}, 6^{\circ}$ ), in particular

6*: if $u, v \in 2^{n}$ then $Y_{u} \upharpoonright_{>v_{\psi}[u, v]}=Y_{v} \upharpoonright_{>v_{\psi}[u, v]}$;
7*: if $u, v \in 2^{n}$ then $Y_{u}\left|\geqslant \nu_{\psi}[u, v] \cap Y_{v}\right| \geqslant v_{\psi}[u, v]=\emptyset$;
where $v_{\psi}[u, v]=\max \{\psi(\ell): \ell<n \wedge u(\ell) \neq v(\ell)\}$ (compare with $\nu_{\varphi}$ above).

It is clear that for any $a \in 2^{\mathbb{N}}$ the intersection $\bigcap_{n} Y_{a \upharpoonright n}=\{f(a)\}$ is a singleton, and the map $f$ is continuous and 1-1. (We can, of course, define $f$ explicitly: $f(a)(p)(K)=a(n)$, where $n \in \mathbb{N}$ is chosen so that $\psi(n)=p$ and there is exactly $K$ numbers $\ell<n$ with $\psi(\ell)=p$.) Note finally that $\left\{f(a): a \in 2^{\mathbb{N}}\right\}=\mathbb{R}^{\mathbb{N}}$ since by definition $Y_{u^{\wedge} 1} \cup Y_{u^{\wedge} 0}=Y_{u}$ for all $u$.

We conclude that the map $\vartheta(x)=g\left(f^{-1}(x)\right)$ is a continuous map (in fact a homeomorphism in this case by compactness) $\mathbb{R}^{\mathbb{N}} \xrightarrow{\text { onto }} X=\operatorname{dom} W$.

Lemma 27. The map $\vartheta$ is a reduction of $\mathrm{E}_{1}$ to $\mathrm{E}_{1} \upharpoonright X$, and hence $\vartheta$ witnesses $\mathrm{E}_{1} \leqslant \mathrm{~B} \mathrm{E}_{1} \upharpoonright X$ and $\mathrm{E}_{1} \leqslant B \mathrm{E}_{13} \upharpoonright W$ by Corollary 26 .
Proof. It suffices to check that the map $\vartheta$ satisfies the following requirement: for each $y, y^{\prime} \in \mathbb{R}^{\mathbb{N}}$ and $m$,

$$
\begin{equation*}
y \upharpoonright_{\geqslant m}=y^{\prime} \upharpoonright \geqslant m \quad \text { iff } \quad \vartheta(y) \upharpoonright \geqslant p_{m}=\vartheta\left(y^{\prime}\right) \upharpoonright \geqslant p_{m} . \tag{7}
\end{equation*}
$$

To prove (7) suppose that $y=f(a)$ and $x=g(a)=\vartheta(y)$, and similarly $y^{\prime}=f\left(a^{\prime}\right)$ and $x^{\prime}=g\left(a^{\prime}\right)=\vartheta\left(y^{\prime}\right)$, where $a, a^{\prime} \in 2^{\mathbb{N}}$. Suppose that $y\left\lceil\geqslant m=y^{\prime} \upharpoonright \geqslant m\right.$. We then have $m>v_{\psi}\left[a \upharpoonright n, a^{\prime} \upharpoonright n\right]$ for any $n$ by $7^{*}$. It follows, by the definition of $\psi$, that $p_{m}>v_{\varphi}\left[a \upharpoonright n, a^{\prime} \upharpoonright n\right]$ for any $n$, hence, $X_{a\lceil n} \upharpoonright \geqslant p_{m}=X_{a^{\prime}\lceil n} \upharpoonright \geqslant p_{m}$ for any $n$ by $5^{\circ}$. Therefore $x \upharpoonright \geqslant p_{m}=x^{\prime} \upharpoonright \geqslant p_{m}$ by $7^{\circ}$, that is, the right-hand side of (7). The inverse implication in (7) is proved similarly.
(Lemma)
It follows that we can now focus on the construction of a system satisfying $1^{\circ}-8^{\circ}$. The construction follows in Section 12, after several preliminary lemmas in Sections 10 and 11.

## 10. Case 2: how to shrink a splitting system

Let us prove some results related to preservation of condition $8^{\circ}$ under certain transformations of shrinking type. They will be applied in the construction of a splitting system satisfying conditions $1^{\circ}-8^{\circ}$ of Section 8 .

Lemma 28. Suppose that $n \in \mathbb{N}, s \in \mathbb{N}^{<\omega}$, and a system of $\Sigma_{1}^{1}$ sets $\emptyset \neq P_{u} \subseteq \mathbb{R}^{\mathbb{N}} \times \mathbb{R}^{\mathbb{N}}, u \in 2^{n}$, satisfies $P_{u} \cong_{v_{\varphi}[u, v]}^{s} P_{v}$ for all $u, v \in 2^{n}$. Assume also that $w_{0} \in 2^{n}$, and $\emptyset \neq Q \subseteq P_{w_{0}}$ is a $\Sigma_{1}^{1}$ set. Then the system of $\Sigma_{1}^{1}$ sets

$$
P_{u}^{\prime}=\left\{\langle x, \xi\rangle \in P_{u}: \exists\langle z, \zeta\rangle \in Q\left(\langle x, \xi\rangle \cong_{v_{\varphi}\left[u, w_{0}\right]}^{s}\langle z, \zeta\rangle\right)\right\}, \quad u \in 2^{n},
$$

still satisfies $P_{u}^{\prime} \cong{ }_{v_{\varphi}[u, v]}^{s} P_{v}^{\prime}$ for all $u, v \in 2^{n}$, and $P_{w_{0}}^{\prime}=Q$.
Proof. $P_{w_{0}}^{\prime}=Q$ holds because $v_{\varphi}\left[w_{0}, w_{0}\right]=-1$. Let us verify $8^{\circ}$. Suppose that $u, v \in 2^{n}$. Each one of the three numbers $v_{\varphi}[u, w], v_{\varphi}[v, w], v_{\varphi}[u, v]$ is obviously not bigger than the largest of the two other numbers. This observation leads us to the following three cases.

Case a: $v_{\varphi}\left[u, w_{0}\right]=v_{\varphi}[u, v] \geqslant v_{\varphi}\left[v, w_{0}\right]$. Consider any $\langle x, \xi\rangle \in P_{u}^{\prime}$. Then by definition there exists $\langle z, \zeta\rangle \in Q$ with $\langle x, \xi\rangle \cong_{v_{\varphi}\left[u, w_{0}\right]}^{s}\langle z, \zeta\rangle$. Then, as $P_{w_{0}} \cong_{v_{\varphi}\left[v, w_{0}\right]}^{s} P_{v}$ is assumed by the lemma, there is $\langle y, \eta\rangle \in P_{v}$ such that $\langle y, \eta\rangle \cong_{v_{\varphi}\left[v, w_{0}\right]}^{s}\langle z, \zeta\rangle$. Note that $\langle z, \zeta\rangle$ witnesses $\langle y, \eta\rangle \in P_{v}^{\prime}$. On the other hand, $\langle x, \xi\rangle \cong_{v_{\varphi}[u, v]}^{s}\langle y, \eta\rangle$ because $v_{\varphi}\left[u, w_{0}\right]=$ $v_{\varphi}[u, v] \geqslant v_{\varphi}\left[v, w_{0}\right]$. Conversely, suppose that $\langle y, \eta\rangle \in P_{v}^{\prime}$. Then there is $\langle z, \zeta\rangle \in Q$ such that $\langle y, \eta\rangle \cong_{v_{\varphi}\left[v, w_{0}\right]}^{s}\langle z, \zeta\rangle$. Yet $P_{w_{0}} \cong \cong_{\nu_{\varphi}\left[u, w_{0}\right]}^{s} P_{u}$, and hence there exists $\langle x, \xi\rangle \in P_{u}^{\prime}$ with $\langle x, \xi\rangle \cong_{\nu_{\varphi}\left[u, w_{0}\right]}^{s}\langle z, \zeta\rangle$. Once again we conclude that $\langle x, \xi\rangle \cong_{v_{\varphi}[u, v]}^{s}\langle y, \eta\rangle$.

Case b: $v_{\varphi}[v, w]=v_{\varphi}[u, v] \geqslant v_{\varphi}[u, w]$. Absolutely similar to Case a.
Case c: $v_{\varphi}\left[u, w_{0}\right]=v_{\varphi}\left[v, w_{0}\right] \geqslant v_{\varphi}[u, v]$. This is a symmetric case, thus it is enough to carry out only the direction $P_{u}^{\prime} \rightarrow P_{v}^{\prime}$. Consider any $\langle x, \xi\rangle \in P_{u}^{\prime}$. As above there is $\langle z, \zeta\rangle \in Q$ such that $\langle x, \xi\rangle \cong_{v_{\varphi}\left[u, w_{0}\right]}^{s}\langle z, \zeta\rangle$. On the other hand, as $P_{u} \cong_{v_{\varphi}[u, v]}^{s} P_{v}$, there exists a point $\langle y, \eta\rangle \in P_{v}$ such that $\langle y, \eta\rangle \cong_{v_{\varphi}[u, v]}^{s}\langle x, \xi\rangle$. Note that $\langle z, \zeta\rangle$ witnesses $\langle y, \eta\rangle \in P_{v}^{\prime}$ : indeed by definition we have $\langle y, \eta\rangle \cong_{v_{\varphi}\left[v, w_{0}\right]}^{s}\langle z, \zeta\rangle$.

Corollary 29. Assume that $n \in \mathbb{N}, s \in \mathbb{N}^{<\omega}$, and a system of $\Sigma_{1}^{1}$ sets $\emptyset \neq P_{u} \subseteq \mathbb{R}^{\mathbb{N}} \times \mathbb{R}^{\mathbb{N}}, u \in 2^{n}$, satisfies $P_{u} \cong_{\nu_{\varphi}[u, v]}^{s} P_{v}$ for all $u, v \in 2^{n}$. Assume also that $\emptyset \neq W \subseteq 2^{n}$, and a $\Sigma_{1}^{1}$ set $\emptyset \neq Q_{w} \subseteq P_{w}$ is defined for every $w \in W$ so that still $Q_{w} \cong \cong_{v_{\varphi}\left[w, w^{\prime}\right]}^{s} Q_{w^{\prime}}$ for all $w, w^{\prime} \in W$. Then the system of $\Sigma_{1}^{1}$ sets

$$
P_{u}^{\prime}=\left\{\langle x, \xi\rangle \in P_{u}: \forall w \in W \exists\langle y, \eta\rangle \in Q_{w}\left(\langle x, \xi\rangle \cong_{v_{\varphi}[u, w]}^{s}\langle y, \eta\rangle\right)\right\}
$$

still satisfies $P_{u}^{\prime} \cong_{\nu_{\varphi}[u, v]}^{s} P_{v}^{\prime}$ for all $u, v \in 2^{n}$, and $P_{w}^{\prime}=Q_{w}$ for all $w \in W$.
Proof. Apply the transformation of Lemma 28 consecutively for all $w_{0} \in W$ and the corresponding sets $Q_{w_{0}}$. Note that these transformations do not change the sets $Q_{w}$ with $w \in W$ because $Q_{w} \cong_{\nu_{\varphi}\left[w, w^{\prime}\right]}^{s} Q_{w^{\prime}}$ for all $w, w^{\prime} \in W$.

Remark 30. The sets $P_{u}^{\prime}$ in Corollary 29 can as well be defined by

$$
P_{u}^{\prime}=\left\{\langle x, \xi\rangle \in P_{u}: \exists\langle y, \eta\rangle \in Q_{w_{u}}\left(\langle x, \xi\rangle \cong_{v_{\varphi}\left[u, w_{u}\right]}^{s}\langle y, \eta\rangle\right)\right\}
$$

where, for each $u \in 2^{n}, w_{u}$ is an element of $W$ such that the number $v_{\varphi}\left[u, w_{u}\right]$ is the least of all numbers of the form $v_{\varphi}[u, w], w \in W$. (If there exist several $w \in W$ with the minimal $v_{\varphi}[u, w]$ then take the least of them.)

## 11. Case 2: how to split a splitting system

Here we consider a different question related to the construction of systems satisfying conditions $1^{\circ}-8^{\circ}$ of Section 8 . Given a system of $\Sigma_{1}^{1}$ sets satisfying a $8^{\circ}$-like condition, how to shrink the sets so that $8^{\circ}$ is preserved and in addition $6^{\circ}$ holds. Let us begin with a basic technical question: given a pair of $\Sigma_{1}^{1}$ sets $P, Q$ satisfying $P \cong{ }_{p}^{s} Q$ for some $p$, s, how to define a pair of smaller $\Sigma_{1}^{1}$ sets $P^{\prime} \subseteq P, Q^{\prime} \subseteq Q$, still satisfying the same condition, but as disjoint as it is compatible with this condition.

Recall that $\operatorname{dom} P=\{x: \exists \xi(\langle x, \xi\rangle \in P)\}$ for $P \subseteq \mathbb{R}^{\mathbb{N}} \times \mathbb{R}^{\mathbb{N}}$.
Lemma 31. If $P, Q \subseteq \mathbb{R}^{\mathbb{N}} \times \mathbb{R}^{\mathbb{N}}$ are non-empty $\Sigma_{1}^{1}$ sets, $p \in \mathbb{N}, s \in \mathbb{N}^{<\omega}, P \cong{ }_{p}^{s} Q$, and $(P \cup Q) \cap S_{p}^{k}=\emptyset$, where $k=1 \mathrm{~h} s$, then there exist non-empty $\Sigma_{1}^{1}$ sets $P^{\prime} \subseteq P, Q^{\prime} \subseteq Q$ such that still $P^{\prime} \cong{ }_{p}^{s} Q^{\prime}$ but in addition (dom $\left.P^{\prime}\right) \upharpoonright \geqslant p \cap\left(\operatorname{dom} Q^{\prime}\right) \upharpoonright \geqslant p=\emptyset$.

Note that $P \cong_{s}^{p} Q$ implies $(\operatorname{dom} P) \upharpoonright_{>p}=(\operatorname{dom} Q) \Gamma_{>p}$.
Proof. It follows from Lemma 23 that there exist points $\left\langle x_{0}, \xi_{0}\right\rangle$ and $\left\langle x_{1}, \xi_{1}\right\rangle$ in $P$ such that $\left\langle x_{0}, \xi_{0}\right\rangle \cong_{p}^{s}\left\langle x_{1}, \xi_{1}\right\rangle$ but $x_{1}(p) \neq x_{0}(p)$. Then there exists a number $j$ such that, say, $x_{1}(p)(j)=1 \neq 0=x_{0}(p)(j)$. On the other hand, there exists $\left\langle y_{0}, \eta_{0}\right\rangle \in Q$ such that $\left\langle x_{i}, \xi_{i}\right\rangle \cong_{p}^{s}\left\langle y_{0}, \eta_{0}\right\rangle$ for $i=0,1$. Then $y_{0}(p)(j) \neq x_{i}(p)(j)$ for one of $i=0$, 1 . Let say $y_{0}(p)(j)=0 \neq 1=x_{0}(p)(j)$. Then the $\Sigma_{1}^{1}$ sets

$$
\begin{aligned}
& P^{\prime}=\left\{\langle x, \xi\rangle \in P: \exists\langle y, \eta\rangle \in Q\left(x(p)(j)=1 \wedge y(p)(j)=0 \wedge\langle x, \xi\rangle \cong_{p}^{s}\langle y, \eta\rangle\right)\right\} \\
& Q^{\prime}=\left\{\langle y, \eta\rangle \in Q: \exists\langle x, \xi\rangle \in P\left(x(p)(j)=1 \wedge y(p)(j)=0 \wedge\langle x, \xi\rangle \cong_{p}^{s}\langle y, \eta\rangle\right)\right\}
\end{aligned}
$$

are $\Sigma_{1}^{1}$ and non-empty (contain resp. $\left\langle x_{0}, \xi_{0}\right\rangle$ and $\left\langle y_{0}, \eta_{0}\right\rangle$ ), and they satisfy $P^{\prime} \cong_{p}^{s} Q^{\prime}$, but (dom $\left.P^{\prime}\right) \upharpoonright \geqslant p \cap\left(\operatorname{dom} Q^{\prime}\right) \upharpoonright \geqslant p=\emptyset$ because $y(p)(j)=0 \neq 1=x(p)(j)$ whenever $\langle x, \xi\rangle \in P^{\prime}$ and $\langle y, \eta\rangle \in Q^{\prime}$.

Corollary 32. Assume that $n \in \mathbb{N}, s \in \mathbb{N}^{<\omega}$, and a system of $\Sigma_{1}^{1}$ sets $\emptyset \neq P_{u} \subseteq \mathbb{R}^{\mathbb{N}} \times \mathbb{R}^{\mathbb{N}}, u \in 2^{n}$, satisfies $P_{u} \cong_{\nu_{\varphi}[u, v]} P_{v}$ for all $u, v \in 2^{n}$. Then there exists a system of $\Sigma_{1}^{1}$ sets $\emptyset \neq P_{u}^{\prime} \subseteq P_{u}, u \in 2^{n}$, such that still $P_{u}^{\prime} \cong{ }_{\nu_{\varphi}[u, v]}^{s} P_{v}$, and in addition $\left(\operatorname{dom} P_{u}^{\prime}\right) \upharpoonright \geqslant v_{\varphi}[u, v] \cap\left(\operatorname{dom} P_{v}^{\prime}\right) \upharpoonright \geqslant v_{\varphi}[u, v]=\emptyset$, for all $u \neq v \in 2^{n}$.

Proof. Consider any pair of $u_{0} \neq v_{0}$ in $2^{n}$. Apply Lemma 31 for the sets $P=P_{u_{0}}$ and $Q=P_{v_{0}}$ and $p=v_{\varphi}\left[u_{0}, v_{0}\right]$. Let $P^{\prime}$ and $Q^{\prime}$ be the $\Sigma_{1}^{1}$ sets obtained, in particular $P^{\prime} \cong{ }_{\nu_{\varphi}\left[u_{0}, v_{0}\right]} Q^{\prime}$ and ( $\left.\operatorname{dom} P^{\prime}\right) \upharpoonright \geqslant v_{\varphi}\left[u_{0}, v_{0}\right] \cap\left(\operatorname{dom} Q^{\prime}\right) \upharpoonright \geqslant v_{\varphi}\left[u_{0}, v_{0}\right]=\emptyset$. Then by Corollary 29 there is a system of $\Sigma_{1}^{1}$ sets $\emptyset \neq P_{u}^{\prime} \subseteq P_{u}$ such that still $P_{u}^{\prime} \cong \cong_{v_{\varphi}[u, v]}^{s} P_{v}^{\prime}$ for all $u, v \in 2^{n}$, and $P_{u_{0}}=P^{\prime}$, $P_{v_{0}}=Q^{\prime}$ - and hence

$$
\left(\operatorname{dom} P_{u_{0}}^{\prime}\right) \mid \geqslant v_{\varphi}\left[u_{0}, v_{0}\right] \cap\left(\operatorname{dom} P_{v_{0}}^{\prime}\right) \Gamma \geqslant v_{\varphi}\left[u_{0}, v_{0}\right]=\emptyset .
$$

Take any other pair of $u_{1} \neq v_{1}$ in $2^{n}$ and transform the system of sets $P_{u}^{\prime}$ the same way. Iterate this construction sufficient (finite) number of steps.

## 12. Case 2: the construction of a splitting system

We continue the proof of Theorem 2 - Case 2. Recall that $R=P_{0} \cap \mathbf{H}$ is a $\Sigma_{1}^{1}$ set. By Lemma 27, it suffices to define functions $\varphi$ and $\pi$ and a system of $\Sigma_{1}^{1}$ sets $P_{u} \subseteq R$ together satisfying conditions $1^{\circ}-8^{\circ}$. The construction of such a system will go on by induction on $n$. That is, at any step $n$ the sets $P_{u}$ with $u \in 2^{n}$, as well as the values of $\varphi(k)$ and $\pi(k)$ with $k<n$, will be defined.

For $n=0$, we put $P_{\Lambda}=R .\left(\Lambda \in 2^{0}\right.$ is the only sequence of length 0 .)
Suppose that sets $P_{u} \subseteq R$ with $u \in 2^{n}$, and also all values $\varphi(\ell), \ell<n$, and $\pi(k), k<n$, have been defined and satisfy the applicable part of $1^{\circ}-8^{\circ}$. The content of the inductive step $n \mapsto n+1$ will consist in definition of $\varphi(n)$, $\pi(n)$, and sets $P_{u^{\wedge} i}$ with $u^{\wedge} i \in 2^{n+1}$, that is, $u \in 2^{n}$ (a dyadic sequence of length $n$ ) and $i=0,1$. This goes on in four Steps A, B, C, D.

### 12.1. Step A: definition of $\varphi(n)$

Suppose that, in the order of increase,

$$
\{\varphi(\ell): \ell<n\}=\left\{p_{0}<\cdots<p_{m}\right\}
$$

For $j \leqslant m$, let $K_{j}$ be the number of all $\ell<n$ with $\varphi(\ell)=p_{j}$.
Case A: $K_{j} \geqslant m$ for all $j \leqslant m$. Then consider any $u_{0} \in 2^{n}$ and an arbitrary point $\left\langle x_{0}, \xi_{0}\right\rangle \in P_{u_{0}}$. Note that by (5) of Section 7 there is a number $p>\max _{\ell<n} \varphi(\ell)$ such that $\left\langle x_{0}, \xi_{0}\right\rangle \notin \bigcup_{k} S_{p}^{k}$. Put $\varphi(n)=p$.

We claim that the sets $P_{u}^{\prime}=P_{u} \backslash \bigcup_{k} S_{\varphi(n)}^{k}$ still satisfy condition $8^{\circ}$ (and then $5^{\circ}$ for $X_{u}^{\prime}=\operatorname{dom} P_{u}^{\prime}$ ). Indeed suppose that $u, v \in 2^{n}$ and $\langle x, \xi\rangle \in P_{u}^{\prime}$. Then $\langle x, \xi\rangle \in P_{u}$, and hence there is a point $\langle y, \eta\rangle \in P_{v}$ such that $\langle x, \xi\rangle \cong \cong_{v_{\varphi}[u, v]}^{\pi \mid n}\langle y, \eta\rangle$. It remains to show that $\langle y, \eta\rangle \notin \bigcup_{k} S_{\varphi(n)}^{k}$. Suppose towards the contrary that $\langle y, \eta\rangle \in S_{\varphi(n)}^{k}$ for some $k$. By definition $\varphi(n)>v_{\varphi}[u, v]$, therefore $x \mid \geqslant \varphi(n)=y\left\lceil\geqslant \varphi(n)\right.$. It follows that $\langle x, \xi\rangle \in S_{\varphi(n)}^{k}$ by Lemma 22, contradiction.

Case B: If some numbers $K_{j}$ are $<m$ then choose $\varphi(n)$ among $p_{j}$ with the least $K_{j}$, and among them take the least one. Thus $\varphi(n)=\varphi(\ell)$ for some $\ell<n$. It follows that in this case $P_{u} \cap\left(\bigcup_{k} S_{\varphi(n)}^{k}\right)=\emptyset$ for all $u \in 2^{n}$ by the inductive assumption of $2^{\circ}$. Put $P_{u}^{\prime}=P_{u}$.

Note that this manner of choice of $\varphi(n)$ implies $1^{\circ}, 2^{\circ}$ and also implies that $\varphi$ takes infinitely many values and takes each its value infinitely many times. In addition, the construction given above proves:

Lemma 33. There exists a system of $\Sigma_{1}^{1}$ sets $\emptyset \neq P_{u}^{\prime} \subseteq P_{u}$ satisfying $8^{\circ}$ and $P_{u}^{\prime} \cap\left(\bigcup_{k} S_{\varphi(n)}^{k}\right)=\emptyset$ for all $u \in 2^{n}$.

### 12.2. Step B: definition of $\pi(n)$

We work with the sets $P_{u}^{\prime}$ such as in Lemma 33. The next goal is to prove the following result:
Lemma 34. There exist a number $r \in \mathbb{N}$ and a system of $\Sigma_{1}^{1}$ sets $\emptyset \neq P_{u}^{\prime \prime} \subseteq P_{u}^{\prime}$ satisfying $P_{u}^{\prime \prime} \cong{ }_{v_{\varphi}[u, v]}^{(\pi \upharpoonright n)^{\wedge} r} P_{v}^{\prime \prime}$ for all $u, v \in 2^{n}$.
Proof. Let $2^{n}=\left\{u_{j}: j<K\right\}$ be an arbitrary enumeration of all dyadic sequences of length $n ; K=2^{n}$, of course. The method of proof will be to define, for any $k \leqslant K$, a number $r_{k} \in \mathbb{N}$ and a system of $\Sigma_{1}^{1}$ sets $\emptyset \neq Q_{u_{j}}^{k} \subseteq P_{u_{j}}^{\prime}$, $j<k$, by induction on $k$ so that
(*) $Q_{u_{i}}^{k} \cong{ }_{v_{\varphi}\left[u_{i}, u_{j}\right]}^{(\pi \upharpoonright)^{\wedge} r_{k}} Q_{u_{j}}^{k}$ for all $i<j<k$. (Where $(\pi \upharpoonright n)^{\wedge} r$ is the extension of the finite sequence $\pi \upharpoonright n$ by $r$ as the new rightmost term.)

After this is done, $r=r_{K}$ and the sets $P_{u}^{\prime \prime}=Q_{u}^{K}$ prove the lemma.
We begin with $k=2$. Then $P_{u_{0}}^{\prime} \cong{ }_{\nu_{\varphi}\left[u_{0}, u_{1}\right]}^{\pi \mid n} P_{u_{1}}^{\prime}$ by $8^{\circ}$, and hence there exist points $\left\langle x_{0}, \xi_{0}\right\rangle \in P_{u_{0}}^{\prime},\left\langle x_{1}, \xi_{1}\right\rangle \in P_{u_{1}}^{\prime}$ such that $\left.\left\langle x_{0}, \xi_{0}\right\rangle \cong \pi \nu_{\varphi} \mid \eta_{0}, u_{1}\right]\left\langle x_{1}, \xi_{1}\right\rangle$. Then $\xi_{0} \mathrm{E}_{3} \xi_{1}$, so that there is a number $r \in \mathbb{N}$ with $\xi_{0}(n) \Delta \xi_{1}(n) \subseteq r_{2}$. Note that for any $p \in \mathbb{N}$ and any points $\langle x, \xi\rangle,\langle y, \eta\rangle \in \mathbb{R}^{\mathbb{N}} \times \mathbb{R}^{\mathbb{N}},\langle x, \xi\rangle \cong_{\nu_{\varphi}\left[u_{0}, u_{1}\right]}^{(\pi \upharpoonright n \wedge r}\langle y, \eta\rangle$ is equivalent to the conjunction

$$
\langle x, \xi\rangle \cong{ }_{\nu_{\varphi}\left[u_{0}, u_{1}\right]}^{\pi \upharpoonright n}\langle y, \eta\rangle \wedge \xi(n) \Delta \eta(n) \subseteq r .
$$

It follows that the sets

$$
\begin{aligned}
& S_{0}=\left\{\langle x, \xi\rangle \in P_{u_{0}}^{\prime}: \exists\langle y, \eta\rangle \in P_{u_{1}}^{\prime}\left(\langle x, \xi\rangle \cong{ }_{\nu_{\varphi}\left[u_{0}, u_{1}\right]}^{(\pi \upharpoonright n \wedge}\langle y, \eta\rangle\right)\right\} \quad \text { and } \\
& S_{1}=\left\{\langle y, \eta\rangle \in P_{u_{1}}^{\prime}: \exists\langle x, \xi\rangle \in P_{u_{0}}^{\prime}\left(\langle x, \xi\rangle \cong{ }_{\nu_{\varphi}\left[u_{0}, u_{1}\right]}^{(\pi \upharpoonright n)^{\wedge}}\langle y, \eta\rangle\right)\right\}
\end{aligned}
$$

are $\Sigma_{1}^{1}$ and non-empty (contain resp. $\left\langle x_{0}, \xi_{0}\right\rangle$ and $\left\langle x_{1}, \xi_{1}\right\rangle$ ), and they obviously satisfy $S_{0} \cong{ }_{\nu_{\varphi}\left[u_{0}, u_{1}\right]}^{(\pi\lceil n \wedge r} S_{1}$. Therefore by Corollary 29 there exists a system of $\Sigma_{1}^{1}$ sets $\emptyset \neq Q_{u}^{2} \subseteq P_{u}^{\prime}, u \in 2^{n}$, such that $Q_{u_{0}}^{2}=S_{0}, Q_{u_{1}}^{2}=S_{1}, 8^{\circ}$ still holds, and in addition $Q_{u_{0}}^{2} \cong{ }_{\nu_{\varphi}\left[u_{0}, u_{1}\right]}^{(\pi \upharpoonright n)^{\wedge} r_{2}} Q_{u_{1}}^{2}$. Put $r_{2}=r$.

Now let us carry out the step $k \mapsto k+1$. Suppose that $r_{k}$ and sets $Q_{u_{j}}^{k}, j<k$, satisfy (*). Of all numbers $v_{\varphi}\left[u_{j}, u_{k}\right]$, $j<k$, consider the least one. Let this be, say, $v_{\varphi}\left[u_{\ell}, u_{k}\right]$, so that $\ell<k$ and $v_{\varphi}\left[u_{\ell}, u_{k}\right] \leqslant v_{\varphi}\left[u_{j}, u_{k}\right]$ for all $j<k$. As above there exists a number $r$ and a pair of non-empty $\Sigma_{1}^{1}$ sets $S_{\ell} \subseteq Q_{u_{\ell}}^{k}$ and $S_{k} \subseteq Q_{u_{k}}^{k}$ such that $S_{\ell} \cong_{v_{\varphi}\left[u_{\ell}, u_{k}\right]}^{(\pi \uparrow n)} S_{k}$. We can assume that $r \geqslant r_{k}$. Put

$$
Q_{u_{j}}^{\prime}=\left\{\langle y, \eta\rangle \in S_{u_{j}}: \exists\langle x, \xi\rangle \in S_{\ell}\left(\langle x, \xi\rangle \cong \cong_{\nu_{\varphi}\left[u_{\ell}, u_{j}\right]}^{(\pi \mid \eta)^{\wedge} r}\langle y, \eta\rangle\right)\right\}
$$

for all $j<k$. The proof of Lemma 28 shows that $Q_{u_{j}}^{\prime}$ are non-empty $\Sigma_{1}^{1}$ sets still satisfying $(*)$ in the form of $Q_{u_{i}}^{\prime} \cong \stackrel{(\pi \uparrow \eta)^{\wedge} r}{v_{\varphi}\left[u_{i}, u_{j}\right]} Q_{u_{j}}^{\prime}$ for $i<j<k-$ since $r \geqslant r_{k}$, and obviously $Q_{u_{\ell}}^{\prime}=S_{\ell}$. In addition, put $Q_{u_{k}}^{\prime}=S_{k}$. Then still $Q_{u_{\ell}}^{\prime} \cong\left(\begin{array}{c}\left(\pi\lceil n)^{\wedge} r\right. \\ \nu_{\varphi}\left[u_{\ell}, u_{k}\right]\end{array}\right.$ $Q_{u_{k}}^{\prime}$ by the choice of $S_{\ell}$ and $S_{k}$. We claim that also

$$
\begin{equation*}
Q_{u_{j}}^{\prime} \cong_{v_{\varphi}\left[u_{j}, u_{k}\right]}^{(\pi \mid n)^{\wedge}} Q_{u_{k}}^{\prime} \quad \text { for all } j<k \tag{8}
\end{equation*}
$$

 $\max \left\{v_{\varphi}\left[u_{j}, u_{\ell}\right], v_{\varphi}\left[u_{\ell}, u_{k}\right]\right\}$. Thus it remains to show that $p \leqslant v_{\varphi}\left[u_{j}, u_{k}\right]$. That $v_{\varphi}\left[u_{\ell}, u_{k}\right] \leqslant v_{\varphi}\left[u_{j}, u_{k}\right]$ holds by the choice of $\ell$. Prove that $v_{\varphi}\left[u_{j}, u_{\ell}\right] \leqslant v_{\varphi}\left[u_{j}, u_{k}\right]$. Indeed in any case

$$
v_{\varphi}\left[u_{j}, u_{\ell}\right] \leqslant \max \left\{v_{\varphi}\left[u_{j}, u_{k}\right], v_{\varphi}\left[u_{\ell}, u_{k}\right]\right\}
$$

But once again $v_{\varphi}\left[u_{\ell}, u_{k}\right] \leqslant v_{\varphi}\left[u_{j}, u_{k}\right]$, so $v_{\varphi}\left[u_{j}, u_{\ell}\right] \leqslant v_{\varphi}\left[u_{j}, u_{k}\right]$ as required.
Thus (8) is established. It follows that $Q_{u_{i}}^{\prime} \cong{ }_{\nu_{\varphi}\left[u_{i}, u_{j}\right]}^{(\pi \upharpoonright n)^{\wedge}} Q_{u_{j}}^{\prime}$ for all $i<j \leqslant k$. We end the inductive step of the lemma by putting $r_{k+1}=r$.
(Lemma)

### 12.3. Step C: splitting to the next level

We work with the number $r$ and sets $P_{u}^{\prime \prime}$ such as in Lemma 34. Put $\pi(n)=r$. (Recall that $\varphi(n)$ was defined at Step A.) The next step is to split each one of the sets $P_{u}^{\prime \prime}$ in order to define sets $P_{u^{\wedge} i}, u^{\wedge} i \in 2^{n+1}$, of the next splitting level.

To begin with, put $Q_{u^{\wedge}}=P_{u}^{\prime \prime}$ for all $u \in 2^{n}$ and $i=0,1$. It is easy to verify that the system of sets $Q_{u^{\wedge} i}, u^{\wedge} i \in 2^{n+1}$, satisfies conditions $1^{\circ}-8^{\circ}$ for the level $n+1$, except for $7^{\circ}$ and $6^{\circ}$. In particular, $2^{\circ}$ was fixed at Step A, and $8^{\circ}$ in the form that $Q_{u^{\wedge} i} \xlongequal[{\nu_{\varphi}\left\lceil u^{\wedge} i, \nu^{\wedge j]}\right.}]{\pi(n+1)} Q_{v^{\wedge} j}$ for all $u^{\wedge} i$ and $v^{\wedge} j$ in $2^{n+1}$ (and then $5^{\circ}$ as well) at Step B - because $(\pi \upharpoonright n)^{\wedge} r=\pi \upharpoonright(n+1)$.

Recall that by definition all sets involved have no common point with $\bigcup_{k} S_{\varphi(n)}^{k}$ by $2^{\circ}$. Therefore Corollary 32 is applicable. We conclude that there exists a system of non-empty $\Sigma_{1}^{1}$ sets $W_{u^{\wedge} i} \subseteq Q_{u^{\wedge}}, u^{\wedge} i \in 2^{n+1}$, still satisfying $8^{\circ}$, and also satisfying $6^{\circ}$.

### 12.4. Step D: genericity

We have to further shrink the sets $W_{u^{\wedge}}, u^{\wedge} i \in 2^{n+1}$, obtained at Step $C$, in order to satisfy $7^{\circ}$, the last condition not yet fulfilled in the course of the construction. The goal is to define a new system of $\Sigma_{1}^{1}$ sets $\emptyset \neq P_{u^{\wedge} i} \subseteq W_{u^{\wedge}}, u^{\wedge} i \in 2^{n+1}$, such that still $8^{\circ}$ holds, and in addition $P_{u^{\wedge} i} \in D_{n}$ for all $u^{\wedge} i \in 2^{n+1}$, where $D_{n}$ is the $n$-th open dense subset of $\mathbb{P}$ coded in $\boldsymbol{M}$.

Take any $u_{0} \wedge_{i_{0}} \in 2^{n+1}$. As $D_{n}$ is a dense subset of $\mathbb{P}$, there exists a set $W_{0} \in D_{n}$, therefore, a non-empty $\Sigma_{1}^{1}$ set, such that $W_{0} \subseteq W_{u_{0} \wedge i_{0}}$. It follows from Lemma 28 that there exists a system of non-empty $\Sigma_{1}^{1}$ sets $W_{u^{\wedge} i}^{\prime} \subseteq W_{u^{\wedge} i}, u^{\wedge} i \in 2^{n+1}$, still satisfying $8^{\circ}$, and such that $W_{u_{0} \wedge i_{0}}^{\prime}=Q_{0}$.

Now take any other $u_{1} \wedge i_{1} \neq u_{0} \wedge i_{0}$ in $2^{n+1}$. The same construction yields a system of non-empty $\Sigma_{1}^{1}$ sets $W_{u^{\wedge} i}^{\prime \prime} \subseteq W_{u^{\wedge} i}^{\prime}$, $u^{\wedge} i \in 2^{n+1}$, still satisfying $8^{\circ}$, and such that $W_{u_{1} \wedge i_{1}}^{\prime \prime}=W_{1} \subseteq W_{u_{1} \wedge i_{1}}^{\prime}$ is a set in $D_{n}$.

Iterating this construction $2^{n+1}$ times, we obtain a system of sets $P_{u^{\wedge} i}$ satisfying $7^{\circ}$ as well as all other conditions in the list $1^{\circ}-8^{\circ}$, as required.
(Construction and Case 2 of Theorem 2)
(Theorems 2 and 1)
